

# CMAQ NH<sub>3</sub> Bidirectional Model Pilot Study Evaluation

### Jesse Bash, Ellen J. Cooter, Robin Dennis, Jon Pleim, Megan Gore 2010 CMAS Conference, October 12<sup>th</sup> Chapel Hill, NC

**Office of Research and Development** National Exposure Research Laboratory | Atmospheric Modeling and Analysis Division Atmospheric Exposure Integration Branch

### <u>Outline</u>

- Objectives and Background
- CMAQ bidirectional NH<sub>3</sub> pilot study
- CMAQ Model simulations
  - Bidirectional and Base model configurations
- Results and Evaluation
  - Bidi and Base model nitrogen budget (Gore et al. 4:10 PM Poster session)
  - NH<sub>x</sub> wet deposition evaluation
  - NH<sub>4</sub> ambient concentration evaluation
- Conclusions

## **Reduced Nitrogen in the Environment**

- NH<sub>3</sub> is the primary atmospheric base
  - Contributes to PM formation
    - Deleterious to human health
- Net acidification impact on soil and contributes to surface water eutrophication
  - Contributes to decline in species biodiversity and ecosystem services
- NH<sub>3</sub> emissions remain uncertain
  - Complex multimedia air-surface exchange processes
  - Difficult to measure fluxes
- Objectives:
  - Develop a mechanistic model for agricultural cropping NH<sub>3</sub> emissions coupled to the bidirectional NH<sub>3</sub> exchange model

### NH<sub>3</sub> air-surface exchange

- Air-surface exchange of NH<sub>3</sub> is bidirectional
- Regional and global models parametrized using the deposition velocity concept
  - A unidirectional approach
- Bidirectional exchange models have been developed and evaluated for field scale applications
- The CMAQ bidirectional NH<sub>3</sub> air-surface exchange model was parametrized using data from a collaborative measurement campaign
  - Evaluated at the field scale
  - Do these processes scale to regional applications?
- NH<sub>3</sub> bidirectional model requires more input parameters
  - Provided by a soil nitrogen model (Cooter et al, 4:10 PM Poster Session)

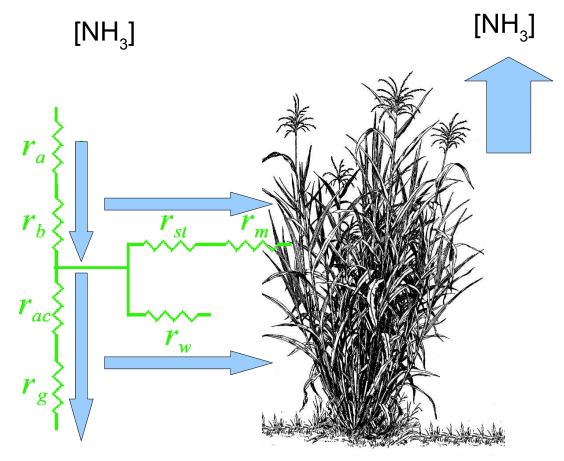

## The NH<sub>3</sub> Compensation Point

- Compensation point is an ambient concentration at which the flux is zero
  - Air-surface system is in equilibrium
- CMAQ NH<sub>3</sub> bidi model has soil and vegetation compensation points
  - Based on the thermodynamic equilibrium of NH<sub>4</sub><sup>+</sup> and H<sup>+</sup> in aqueous solutions in soil and vegetation
    - Non-agriculture land cover based on mean observed values
    - Agriculture land cover based on geochemical cycling model estimates
- Soil and vegetation compensation points and resistance model used to define a canopy compensation point

## **Unidirectional Exchange**

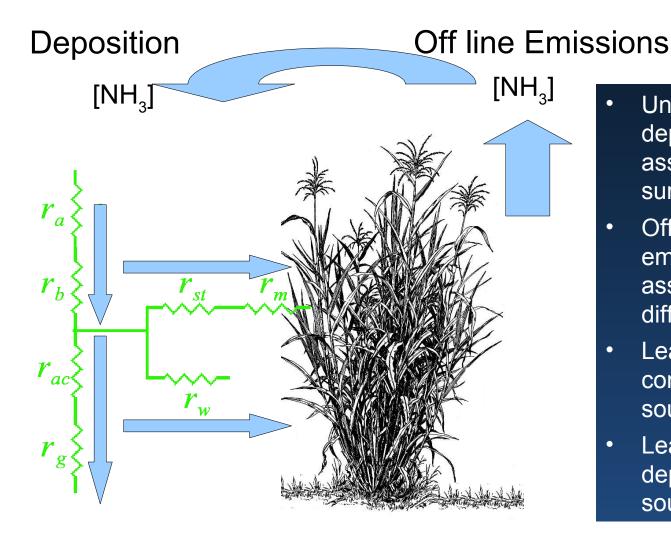

### Deposition

### **Off line Emissions**

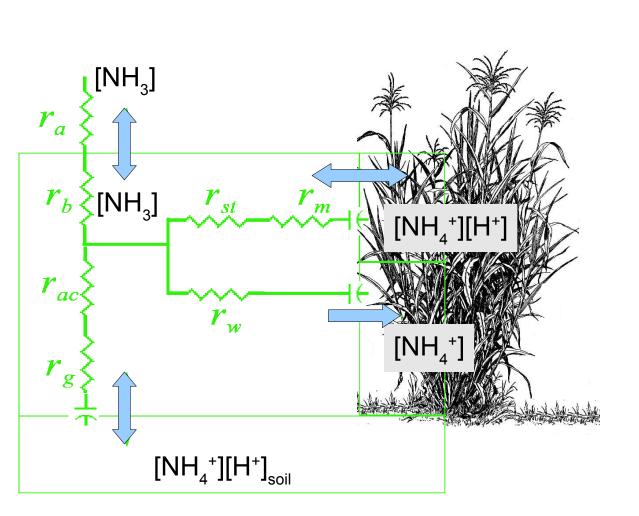

- Unidirectional dry deposition velocity assumes the surface is a sink
- Off line emission emissions model assumptions may differ
- Leads to high concentrations over sources
- Leads to high deposition over sources

### **Unidirectional Exchange**

- Unidirectional dry deposition velocity assumes the surface is a sink
- Off line emission emissions model assumptions may differ
- Leads to high concentrations over sources
- Leads to high deposition over sources

## **Bidirectional Exchange**

- Parametrizes a net flux over sources and sinks
- Consistent set of assumptions
- Parametrized from field studies
- Multiple source/sink system
  - Component fluxes contribute to net flux

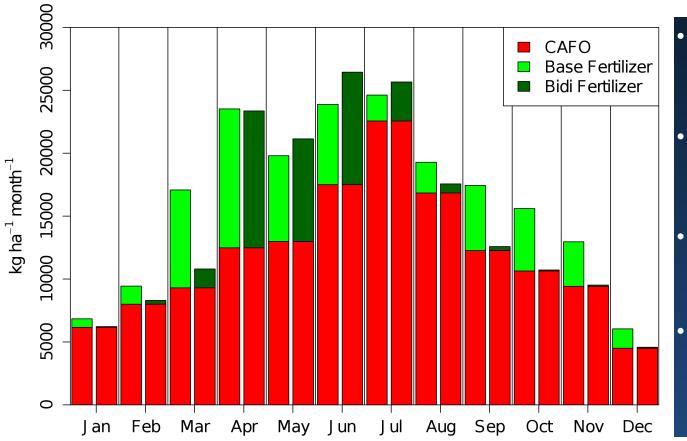

### **Model Simulations**

- 2002 annual simulations
- Base Case
  - CMAQ 4.7.1
  - 2002af NEI emissions
  - Based on CMU estimates of fertilizer NH<sub>3</sub> emissions
- Bidi Case
  - CMAQ 4.7.1 with bidirectional NH<sub>3</sub> exchange
  - 2002af NEI emissions without fertilizer emissions
  - Agricultural soil NH<sub>4</sub><sup>+</sup> and H<sup>+</sup> based on parametrizations of soil nitrification and acidification processes
    - Land use and crop information based on USDA farm-level survey information

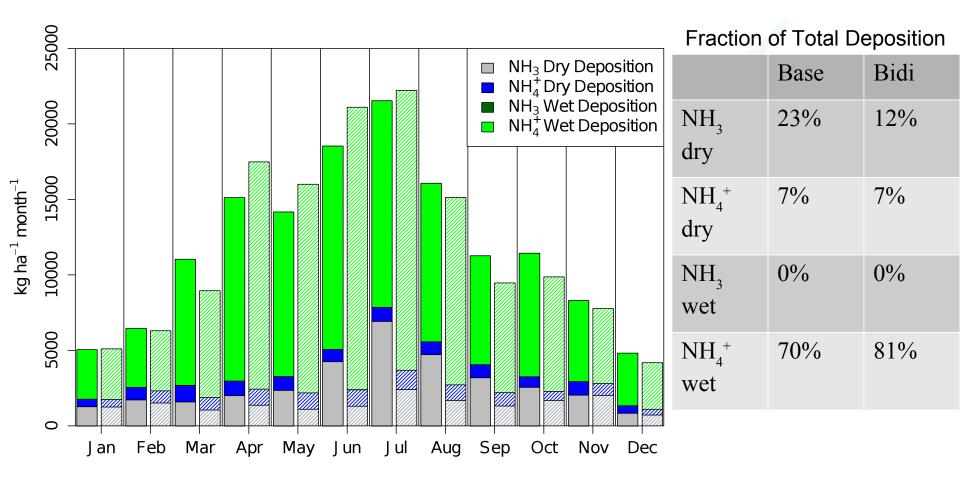

### **Annual Emissions**

- Base fertilizer emissions 34% of total NH<sub>3</sub> emissions
- Bidi fertilizer emissions 31% of total NH<sub>3</sub> emissions
- 11% reduction in emissions in Bidi model
- Bidi changes the deposition of NH<sub>3</sub>

## Annual Deposition (Non agriculture land use)

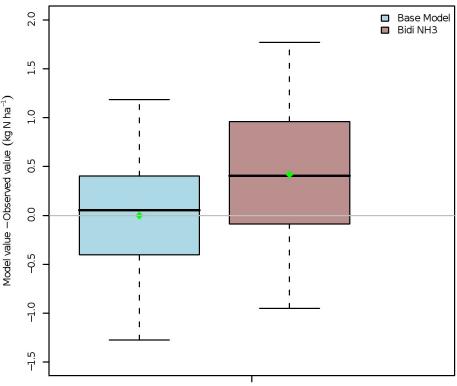

## Evaluation against NADP NH<sub>x</sub> Wet Deposition

### **Precipitation Correction**

Mod. Precip./Obs. Precip

- Modeled annual precipitation biases introduce biases in wet deposition estimates
- Precipitation and deposition biases significantly (p<0.001) correlated
- Better correlation regionally
- Wet deposition results linearly adjusted to correct for precipitation biases
- For more details see Foley et al. at the 4:00 poster session

### **Regional Improvements in NH**<sup>+</sup>

- Annual bias at CASTNet sites reduced from -12% to -4%
- NH<sub>3</sub> emissions in the region changes less than 5%
- Increase in concentrations was due to changes in dry deposition
  - $\downarrow NH_3$  Dry deposition
  - $\uparrow$  NH<sub>4</sub> Concentrations
  - $\uparrow$  NH<sub>4</sub> Dry Deposition
  - $\uparrow$  NH<sub>x</sub> Wet Deposition

### Conclusions

- CMAQ with Bidi NH<sub>3</sub> was coupled to an agricultural soil nitrogen cycle model
- Reduced dry deposition
  - By a factor of 2 at background sites
  - By a factor of 3 for the model domain
- Increased partitioning to the aerosol phase and wet deposition
- Increased transport of reduced N out of the modeling domain by ~10%
- Improvements in precipitation corrected wet deposition and ambient aerosol estimates support these changes in the NH<sub>3</sub> emissions and fate

### **Caveats and Future Research**

- Ambient NH<sub>3</sub> measurements needed for a more robust model evaluation
  - Ambient surface observations from AmoN and TES satellite derived observations are becoming available
  - Need 2009 meteorology and emissions for CMAQ
- Need to revisit CAFO NH<sub>3</sub> emissions
  - Were developed using inverse modeling techniques on a previous version of CMAQ
    - Will improvements in modeling science and inverse modeling techniques improve these estimates?
- Beta version of an in-line fertilizer scenario application tool are in development for the next release of CMAQ

### **Questions?**

Thanks to John Walker, Robert Pinder, Kristen Foley, and Wyat Appel
