1. Overview

1.1 Overall Objective and Basic Structure

The Atmospheric Model Evaluation Tool (AMET) (Gilliam et al., 2005) is a suite of software designed to facilitate the analysis and evaluation of meteorological and air quality models. AMET matches the model output for particular locations to the corresponding observed values from one or more networks of monitors. These pairings of values (model and observation) are then used to statistically and graphically analyze the model's performance.

More specifically, AMET is currently designed to analyze outputs from the PSU/NCAR Mesoscale Modeling System (MM5), the Weather Research and Forecasting (WRF) model, and the Community Multiscale Air Quality (CMAQ) model. The basic structure of AMET consists of two *fields* and two *processes*.

- The two fields (scientific topics) are **MET** and **AQ**, corresponding to meteorology and air quality data.
- The two processes (actions) are **database population** and **analysis**.
 - Database population refers to inserting data into the underlying AMET database. After the observations and model data are paired in space and time, the pairs are inserted into the database.
 - Analysis refers to the statistical evaluation of these pairings and their subsequent plotting.

Practically, a user may be interested in using only one of the fields (either MET or AQ), or they may be interested in using both fields. That decision is based on the scope of the study. The three main software components of AMET are MySQL (an open source database software system), R (a free software environment for statistical computing and graphics), and perl (an open source cross-platform programming language).

1.2 Concept of an AMET "Project"

A central organizing structure for AMET applications is a *project*. A project groups a particular model simulation (specific model, physics-set, spatial domain, grid scale, etc.) with all of the AMET database tables that correspond to that simulation, the scripts necessary to populate that database, and the scripts required to analyze that project. For example, you might have one project for a 2002 36-km continental U.S. simulation, and another project for a 2002 12-km Eastern U.S. simulation. A project can be only for MET or AQ or both. It is essential that you uniquely name each project. It is recommended that you follow the directory structure when creating new projects, specifically by copying one of the three example directories (aqExample, mm5Example, wrfExample) provided with the installation, and then

renaming it to the new project's name.

1.3 Organization of This User's Guide

The Institute for the Environment at the University of North Carolina (UNC) at Chapel Hill has created this user's guide to assist you in applying the AMET system in your work. UNC obtained the MET and AQ portions of AMET separately from EPA, and has integrated the two to create a consistent and integrated AMET package that uses the UNIX C-shell interface to perform both MET and AQ model evaluation and analyses. After this integration, we tested the integrated AMET package on multiple environments, and have created this user's guide.

We have laid out the rest of this document as follows:

- Section 2 describes the overall directory structure of the AMET installation.
- Section 3 gives instructions on how to configure the Perl and R configuration files.
- In Section 4 is an overview of the various model outputs and observed data provided with the AMET release.
- Section 5 provides instructions on how to create the AMET MySQL database, with specific instructions for each of the MET and AQ models. Sample MySQL commands are also shown for illustrative SQL queries.
- Section 6 gives instructions on how to populate the AMET MySQL database, with specific instructions for each of the MM5, WRF, and CMAQ models, and also on how to create a new MET project and a new AQ project for subsequent analyses.
- In Section 7 are instructions on how to perform model evaluation for each of the WRF and CMAQ models, and includes an overview of the functionality of all the MET and AQ evaluation scripts provided.
 - IMPORTANT NOTE: The set of analyses/evaluation scripts provided in this release are strictly for illustration purposes on the functionality/design of AMET, and are not to be construed as a recommended suite of analyses scripts for model evaluation. We encourage the user community to use the scripts we have provided as examples as well as a basis to start developing other analyses scripts and contribute them to the modeling community to increase AMET functionality.
- Section 8 discusses how to obtain support for AMET from the Community Modeling and Analysis System (CMAS) Center (http://www.cmascenter.org).
- In Appendix A is an overall flow diagram for AMET and its various components.
- Appendix B provides information on the various input files used in AMET. For each input file, a table lists brief descriptions of all user-defined variables that can be set by the user for a given evaluation.

Before using AMET and this user's guide, you must first install the AMET package on your

system. For further information on that installation process, please see the separate AMET installation guide that can be downloaded from the CMAS website.

2. Directory Structure

In our discussions, we refer to the top of the AMET directory structure as "\$AMETBASE". This environment variable is actually set in many of the scripts discussed below. For example, if you had untarred AMET's tarfile in your home directory, then AMETBASE would be ~/AMET.

Under \$AMETBASE are the directories shown in Table 2-1.

Table 2-1. Directories under \$AMETBASE.

Directory	Description
bin	External executables used by helper scripts.
configure	Configuration files for Perl and R.
model_data	Model output data (contains field-specific [i.e., MET and AQ] subdirectories).
obs	Observational data (e.g., MADIS, discussed in Section 4.2) (contains field-specific [i.e., MET and AQ] subdirectories).
output	Output of database population and analysis (contains project-specific subdirectories).
perl	Perl scripts used primarily for database population.
R	R scripts used for statistical analysis.
scripts_analysis	Project-specific wrapper scripts and inputs for analysis (contains project-specific subdirectories).
scripts_db	Project-specific wrapper scripts and inputs for database population (contains project-specific subdirectories).
src	Source code for third-party software.

Note: For large model outputs and for MADIS observations that cover a long period of time, it may be prudent to link these data within the appropriate AMET directories rather than moving or copying them.

3. Configuration

After untarring the AMET code and data and installing/building the required three tiers of software components (as discussed in the AMET installation guide referenced above), the next stage is to configure the AMET system. In the \$AMETBASE/configure directory, you will find four files:

- A perl configuration file (amet-config.pl).
- An R configuration file (amet-config.R).
- Two Meteorological Assimilation Data Ingest System (MADIS) configuration files (MET_matching.conf and MET_matching_nonPX.conf). These configuration files describe how MADIS variables "match" (map or translate to) various MET model variables. Most users will not need to change these variable mapping files, so they are not discussed further in this guide. For the AQ side, the matching of variables between model output and observations is project specific. See section 6.5, "Creating a New AQ Project," in the "Database Population" for more details on changing the default mapping of AQ observations to model variables.

3.1 Perl Configuration File (amet-config.pl)

The Perl configuration file is used by the underlying Perl programs to populate the database with the data pairs created by AMET's matching of model output for particular locations to corresponding observed values (these data pairs are referred to in this document as "model-obs pairs"). Most users will need to modify only a few specific lines of this configuration file. The most common variables to change are shown in Table 3-1.

Table 3-1. Most common variables that need to be changed in amet-config.pl.

Variable	Description
\$mysql_server	The MySQL server location. Examples are localhost if MySQL is installed on the same machine on which you have installed AMET, or rama.cempd.unc.edu if you have installed the MySQL server on a remote host called rama.
<pre>\$root_pass</pre>	Password for ametsecure, or your \$root_login (if you changed it from "ametsecure"). This MySQL user will be created later when you are working through Section 5. If security is of high concern, you are urged to change the permissions of the file to allow only the user to read and write.

Variable	Description		
<pre>\$perl_lib</pre>	Location of additional Perl libraries. In our testing, we added additional libraries through the Comprehensive Perl Archive Network (CPAN) to /usr/local/lib/perl. Below that is the version number directory, and below that are the additional modules.		
\$R_lib	All of the R library paths that should be searched by the R scripts. In our installation, they are /usr/local/pkgs/Rpackages:\$R dir/lib/R/site-library, since we installed additional R libraries under /usr/local/pkgs/Rpackages.		
\$fslftp_madis1	MADIS ftp site (MADIS is discussed in Section 4.2).		
\$login_madis1	MADIS-provided login.		
\$pass_madis1	MADIS-provided password.		
\$pass_ncep1	Anonymous password for the National Centers for Environmental Prediction (NCEP); this is usually your e-mail address. Note the necessary "\@".		

¹Needed only if using MET side.

3.2 R Configuration File (amet-config.R)

The R configuration file is used by the underlying R programs to perform statistical analysis on your model-obs pairs. Most users will need to modify only a few specific lines of this configuration file. The most common variables to change are shown in Table 3-2.

Table 3-2. Most common variables that need to be changed in amet-config.R.

Variable	Description
server	The MySQL server location. Examples are localhost if MySQL is installed on the same machine on which you have installed AMET, or rama.cempd.unc.edu if you have installed the MySQL server on a remote host called rama.
passwd	Password for ametsecure, or your login (if you changed it from "ametsecure"). This MySQL user will be created later when you are working through Section 5. If security is of high concern, you are urged to change the permissions of the file to allow only the user to read and write. <i>Note</i> , the R and perl configuration files should have matching passwords and logins.
Bldoverlay_exe ¹	The location of the bldoverlay Fortran executable, most likely \$AMETBASE/bin/bldoverlay .
R_lib	All of the R library paths that should be searched. In our installation, they are: /usr/local/pkgs/Rpackages:\$R dir/lib/R/site- library, since we installed additional R libraries under /usr/local/pkgs/Rpackages.

¹Needed only if using AQ side of AMET.

4. Datasets

The AMET release includes both model and observational datasets provided as examples, and which should have been downloaded by you into the proper directories during the installation process.

4.1 Model Data

For the model data, we have included both meteorological and air quality data. We have organized the data into three example projects: "mm5Example", "wrfExample", and "aqExample". On the MET side, there is a 5-day MM5 simulation (July 04 2002 00:00 UTC to July 08 2002 23:00 UTC) and a 5-day WRF simulation (July 05 2002 00:00 UTC to July 09 2002 23:00 UTC). The MM5 data file is

\$AMETBASE/model data/MET/mm5Example/MMOUT_DOMAIN1_02Jul04

Note that we have bolded "mm5Example" in the directory name above to highlight the fact that

we are using the project name to organize the model output files into directories.

The WRF data consist of five WRF output files in netCDF format:

```
$AMETBASE/model_data/MET/wrfExample/
wrfout_d01_2002-07-05_00:00:00
wrfout_d01_2002-07-06_00:00:00
wrfout_d01_2002-07-07_00:00:00
wrfout_d01_2002-07-08_00:00:00
wrfout_d01_2002-07-09_00:00:00
```

On the AQ side, we have included two CMAQ output files for the period July 01 2002 0:00 UTC to July 11 2002 00:00 UTC. The two files:

```
$AMETBASE/model_data/AQ/aqExample/test.36km.conctest.36km.dep
```

correspond to the concentration and wet deposition output files from CMAQ, after they have been post-processed with the combine utility.

All of the spatial domains cover the continental U.S. and have a 36-km grid resolution.

4.2 Observational Data

As with the model data, the observations directory structure is divided between MET and AQ fields. On the MET side, all of the observations come from Meteorological Assimilation Data Ingestion System (MADIS), provided by the National Oceanic and Atmospheric Administration (NOAA). If you are going to use AMET for MET analysis, you must first contact MADIS to obtain a MADIS account, login, and password (see http://www-sdd.fsl.noaa.gov/MADIS for details). You will use this login information in setting up the Perl configuration file (discussed in Section 3.1).

In the AMET structure, all of the MADIS data are stored under \$AMETBASE/obs/MET. The file stations.csv is a metadata file that describes the station ID and location of each of the MADIS monitoring sites; this file is in comma-separated-value (.csv) format. The AMET distribution from CMAS will not include any MET observations from MADIS. When you run the database population scripts (Section 6), they will automatically call the MADIS system to download the available monitoring sites' observations for the specified time period via ftp. For example, the radiosonde data will be downloaded to

```
$AMETBASE/obs/MET/point/raob/netcdf
```

Each of the observation files is a netCDF file representing one hour's worth of data from all available monitoring sites. Note that the default settings for the MADIS obs extraction are set in template files in \$AMETBASE/bin/madis_input. You can modify these template files to extract mesonet data if desired. Also, you can adjust the quality control level from its current highest level. See the MADIS documentation available from their web site for more information

on how to customize these template files.

On the AQ side, we have included the observation data for the following networks: Air Quality System (AQS) network, Clean Air Status and Trends Network (CASTNET), Interagency Monitoring of Protected Visual Environments (IMPROVE) network, Mercury Deposition Network (MDN), National Atmospheric Deposition Program (NADP) network, SouthEastern Aerosol Research and Characterization Study (SEARCH) network, and the Speciated Trends Network (STN). The observational datasets have been preprocessed and reformatted (in some instances from their original sources) for access by AMET. The temporal range is network dependent, and ranges from 2001 to 2006. The monitoring station locations are provided by a series of .csv files under the subdirectory \$AMETBASE/obs/AQ/site_lists. A brief synopsis of each network, along with the steps taken to create these data for AMET is provided below.

4.2.1. Clean Air Status and Trends Network (CASTNet) Weekly:

Source: Clean Air Status and Trends Network (CASTNet) data are obtained through the CASTNet website located at http://www.epa.gov/castnet/. Weekly CASTNet data can be obtained by downloading the "drychem" file under the prepackaged datasets on the CASTNet website. No post-processing of the downloaded data is necessary in order to be compatible with the Site Compare (sitecmp) software packaged with the AMET system.

Species used with AMET: Observed species name; Model species name (Units)

```
tso4; ASO4T (\mug/m³)
tno3; ANO3T (\mug/m³)
tnh4; ANH4T (\mug/m³)
tno3+nhno3; ANO3T+HNO3_UGM3 (TNO3; \mug/m³)
nhno3; HNO3_UGM3 (\mug/m³)
wso2; SO2_UGM3 (\mug/m³)
```

4.2.2. Clean Air Status and Trends Network (CASTNet) Hourly:

Source: Clean Air Status and Trends Network (CASTNet) data are obtained through the CASTNet website located at http://www.epa.gov/castnet/. Hourly CASTNet ozone data can be obtained by downloading the files labeled "ozone_yyyy" under the prepackaged datasets on the CASTNet website. Additionally, a "metdata_yyyy" file is also available on the CASTNet website, which contains several meteorological variables in addition to ozone. No post-processing of the downloaded data is necessary in order to be compatible with AMET's sitecmp.

Species used with AMET:

Ozone; ozone (ppb)

Additional Species that could be used with AMET:

Surface Temperature

Relative Humidity

Solar Radiation

Precipitation

10m Wind Speed

10m Wind Direction

4.2.3. Interagency Monitoring of PROtected Visual Environments:

Source: Interagency Monitoring of Protected Visual Environments (IMPROVE) data can be through the IMPROVE website located at http://vista.cira.colostate.edu/improve/. The IMPROVE website links to the Visibility Information Exchange Web System (VIEWS) website, which is an interactive system for downloading various air quality related data. IMPROVE data obtained through the VIEWS system do not require any additional processing to work with AMET's sitecmp. See sitecmp documentation for additional information.

Species used with AMET:

```
SO4f_val; ASO4T (\mu g/m^3)

NO3f_val; ANO3T (\mu g/m^3)

NH4f_val; ANH4T (\mu g/m^3)

MF_val; PM25 (\mu g/m^3)

OCf_val; PM_OC (\mu g/m^3)

ECf_val; AECT (\mu g/m^3)

OCf_val+ECf_val; PM_OC+AECT (TC; \mu g/m^3)
```

4.2.4. Mercury Deposition Network (MDN):

<u>Source:</u> Data from the Mercury Deposition Network (MDN) are obtained through the NADP/MDN network website located at http://nadp.sws.uiuc.edu/mdn/. Data are available for download as a comma delimited file for all sites. No post-processing of the downloaded data is necessary in order to be used with AMET's sitecmp.

<u>Species used with AMET</u> (from CMAQ deposition file):

```
HGconc; TWDEP_HG (ng/L)
HGdep; TWDEP_HG (μg/m<sup>2</sup>)
```

4.2.5. National Atmospheric Deposition Program (NADP)

<u>Source</u>: Data for the National Atmospheric Deposition Program (NADP) are obtained through the NADP/NTN website located at http://nadp.sws.uiuc.edu/. Weekly wet concentration data are downloaded in comma delimited format directly from the NADP website. No post-

processing of the downloaded data is necessary in order to be used with AMET's sitecmp.

<u>Species used with AMET</u> (from CMAQ deposition file):

```
NH4; WDEP_NHX (mg/L or kg/ha)
NO3; WDEP_TNO3 (mg/L or kg/ha)
SO4; WDEP_ASO4T (mg/L or kg/ha)
```

4.2.6. SouthEastern Aerosol Research and Characterization (SEARCH) Study:

Source: SouthEastern Aerosol Research and Characterization (SEARCH) Study data are obtained through the SEARCH website located at http://www.atmospheric-research.com/public/index.html. The SEARCH data can be downloaded as comma delimited files for each SEARCH site. In order to be used with sitecmp and AMET, the individual site files must first be merged together into a single file. The example SEARCH data file provided with AMET should serve as an example of how the raw SEARCH data need to be combined and formatted in order to work with sitecmp and AMET.

Species used with AMET:

```
o3; O3 (ppb)
co; CO (ppb)
so2; SO2 (ppb)
no; NO (ppb)
hno3; HNO3 (ppb)
teom; PM25 (μg/m³)
no3; ANO3T (μg/m³)
so4; ASO4T (μg/m³)
nh4; ANH4T (μg/m³)
noy; NOY (ppb)
```

4.2.7. Speciation Trends Network (STN):

Source: The Speciation Trends (STN) network data are obtained through the EPA's Air Quality System (AQS) located at http://www.epa.gov/ttn/airs/airsaqs/. The data provided with the AMET are a sample of STN data that can be obtained through the AQS. No post-processing of the downloaded STN data is necessary in order to work with sitecmp and AMET.

Species used with AMET:

```
m_so4; ASO4T (μg/m<sup>3</sup>)
m_no3; ANO3T (μg/m<sup>3</sup>)
m_nh4; ANH4T (μg/m<sup>3</sup>)
```

```
FRM PM<sub>2.5</sub> Mass; PM<sub>2.5</sub> (µg/m<sup>3</sup>)
oc_adj; PM_OC (µg/m<sup>3</sup>)
ec_niosh; AECT (µg/m<sup>3</sup>)
oc_adj+ec_niosh; PM_OC+AECT (TC; µg/m<sup>3</sup>)
```

4.2.8. Air Quality System (AQS):

Source: The Air Quality System (AQS) network data are obtained through EPA's Air Quality System (AQS) located at http://www.epa.gov/ttn/airs/airsaqs/. Various species of atmospheric gases are available for download through the AQS. Though only ozone data are provided with the AMET release, both sitecmp and AMET are capable of processing other gaseous species available through the AQS (some customization is required however).

Species used with AMET:

ozone; ozone (ppb)

5. Database Setup

The next step in using AMET is to set up the MySQL database. Please refer to the flow diagram in Appendix A to understand the overall flow of data between the various modules within AMET. This section must be completed before you populate the database with your project-specific data (Section 6). This setup process is required only once for a given AMET installation. There are separate setup procedures for the two fields, MET and AQ. If you are using AMET for only one of those fields, you need only run the corresponding setup. If you are running AMET for both fields, you will need to run both setups. In the following discussion, we assume the default name of the AMET database, "amet", and the default AMET MySQL user, "ametsecure". If you decide to change either of these, then you will need to update the appropriate variables in the Perl and R configuration files in the directory \$AMETBASE/configure (see Section 3). Before you run the setup scripts, you will need to know the "root" password for the MySQL administrator. Note that this is not the "ametsecure" password that will be created using the scripts discussed below.

5.1 MET Setup

Go to the setup directory

```
$ cd $AMETBASE/scripts db/setupMET
```

Here, you will see a series of C-shell scripts (.csh) and an input file (.input). The input file, sites_meta.input, defines the metadata file for the MADIS stations (station ID, location, etc.).

To initialize the MET side of AMET, you will need to edit and run the initialize met db.csh script. Specifically, you should make sure the value of

AMETBASE corresponds to your system. If you have already run the setup procedure for AQ, you should set the variable "new_db" to "N"; otherwise set it to "Y" to create a new amet database. Run the initialize script

This will ask you for MySQL's "root" password. It will then set up the AMET database, "amet", and the AMET user, "ametsecure". It will also create two tables in your amet database: stations (observation sites metadata) and project_log (contains summary information for each MET project).

The setup directory also contains scripts for removing projects and removing the amet database. To delete a specific MET project, use

```
$./delete project.csh
```

This script will ask you for the name of the project to delete. **CAUTION:** This will delete all of the tables in the database corresponding to that project.

To delete the amet database from MySQL, use

```
$./delete db.csh
```

This script will ask you for the MySQL "root" password before proceeding. *Use this script with EXTREME CAUTION* because this will delete all of the data in the database corresponding to all of the projects (both MET and AQ).

5.2 AQ Setup

Go to the setup directory

```
$ cd $AMETBASE/scripts db/setupAQ
```

As for the MET setup, you will see a series of C-shell scripts and an input file. The input file, <code>sites_meta.input</code>, defines the metadata files for the various AQ monitoring networks (station ID, location, etc.).

To initialize the AQ side of AMET, you will need to edit and run the initialize_aq_db.csh script. Specifically, you should make sure the value of AMETBASE corresponds to your system. If you have already run the setup procedure for MET, you should set the variable "new_db" to "N"; otherwise set it to "Y" to create a new amet database. Run the initialize script

```
$ ./initialize aq db.csh
```

This will ask you for MySQL's "root" password. It will then set up the AMET database, "amet", and the AMET user, "ametsecure". It will also create three tables in your amet database: site_metadata (observation sites metadata), project_units (contains species-

specific units for each project), and aq_project_log (contains summary information for each AQ project).

The setup directory also contains scripts for removing projects and removing the amet database. To delete a specific MET project, use

```
$./delete project.csh
```

This script will ask you for the name of the project to delete. **CAUTION:** This will delete all of the tables in the database corresponding to that project.

To delete the amet database from MySQL, use

```
$./delete_db.csh
```

This script will ask you for the MySQL "root" password before proceeding. *Use this script with EXTREME CAUTION* because this will delete all of the data in the database corresponding to **all** of the projects (**both MET and AO**).

5.3 Basic MySQL Commands

As you begin to go through the amet database setup and the project-specific database populate, you may want to query the database directly to see your progress. Here are a few commands to help you interact directly with the MySQL amet database. For more specifics, see one of the many MySQL books available, or look at the documentation under

```
http://dev.mysql.com/doc
```

To log onto the MySQL server from the command line, type

```
$ mysql -u ametsecure -D amet -p
```

This will give you a MySQL prompt ("mysql>"). Note that all MySQL commands are case insensitive, and they must end with a semicolon (";").

To get a list of all the tables in your database, type

```
mysql> show tables;
```

After you have populated all of the example projects (end of Section 6), that command will yield a table like this:

```
project_log
project_units
site_metadata
stations
wrfExample_profiler
wrfExample_raob
wrfExample_surface
```

To select every column and row in your project log table:

```
mysql> select * from project log;
```

To select the latitude, longitude, and common name columns from the stations metadata table and limit the results to the first 20 rows:

```
mysql> select lat,lon,common_name from stations limit 20;
```

To select all station metadata where the monitor is from the CASTNET network:

```
mysql> select * from site metadata where network='castnet';
```

To determine which networks are included in the agExample project:

```
mysql> select distinct network from aqExample;
```

6. Database Population

The database population phase of AMET must be performed for each new project. As discussed in Section 1.2, the *project* is the organizing structure that we use to group a particular model simulation with the scripts and data used to populate the amet tables. If you go to the database populate directory by typing

```
$ cd $AMETBASE/scripts db
```

you will see three project directories, in addition to the setup directories described earlier. The projects are: (a) a MET example for the WRF model (wrfExample), (b) a MET example for the MM5 model (mm5Example), and (c) an AQ example for the CMAQ model (aqExample). In the following subsections, we describe how to run each project.

6.1 The wrfExample Project

Go to the project directory

```
$ cd $AMETBASE/scripts db/wrfExample
```

Here, you will see two input files and one C-shell script. The setup_project.input file is the input file for initializing the project's database tables (discussed later in Section 6). The only

thing that you should need to change in this file is the "\$email" variable. Note that you should use the backslash "escape" character, "\", to prevent Perl from evaluating the "@" in your e-mail address. The populate_project.input file describes specific flags for the model outputs and observations that you want to process. See Appendix B for information on the specifics relating to each variable. You will likely not need to change anything in this second input file.

The C-shell file metProject.csh is a wrapper script for calling the Perl programs that actually populate the AMET database with the project data. The variables that you will likely change for this project are "AMETBASE" and "TOP"; the latter is the location of the top-level directory of your MADIS installation. Run the script by typing

\$./metProject.csh >& log.populate

This C-shell script will create three empty project tables in the AMET database: wrfExample_profiler, wrfExample_raob, and wrfExample_surface. These tables correspond to the matches between the model outputs and (1) the wind profiler observations, (2) the radiosonde observations, and (3) the surface observations. After creating these tables, the script then begins the matching process. This consists of auto-ftping data from the MADIS web site for the model's temporal period, finding the geographic location of each observation site on the model grid and interpolating to those locations, and then populating the appropriate table with the model-obs pairs for each variable. Finally, the script updates the project_log with summary information for the wrfExample project.

6.2 The mm5Example Project

Go to the project directory:

\$cd \$AMETBASE/scripts_db/mm5Example

Here, you will see two input files and one C-shell script. The setup_project.input file is the input file for initializing the project's database tables (discussed later in Section 6). The only thing that you should need to change in this file is the "\$email" variable. Note that you should use the backslash "escape" character, "\", to prevent Perl from evaluating the "@" in your e-mail address. The populate_project.input file describes specific flags for the model outputs and observations that you want to process. See Appendix B for information on the specifics relating to each variable. You will likely not need to change anything in this second input file. Note that the MM5 model has been run with the Pleim-Xiu (PX) surface model and has the relevant flags for this configuration; see Appendix B for more information.

The C-shell file metProject.csh is a wrapper script for calling the Perl programs that actually populate the AMET database with the project data. The variables that you will likely change for this project are "AMETBASE", "TOP", and "MADIS_DATA". The "TOP" directory is the location of the top-level directory of your MADIS installation, and the "MADIS_DATA" directory is the location of the MADIS data archive, typically \$AMETBASE/obs/MET. Run the script by typing

\$./metProject.csh >& log.populate

This C-shell script will create three empty project tables in the AMET database: mm5Example_profiler, mm5Example_raob, and mm5Example_surface. These tables correspond to the matches between the model outputs and (1) the wind profiler observations, (2) the radiosonde observations, and (3) the surface observations. After creating these tables, the script then begins the matching process. This consists of converting the MM5 output file into a netCDF file, auto-ftping data from the MADIS web site for the model's temporal period, finding the geographic location of each observation site on the model grid and interpolating to those locations, and then populating the appropriate table with the model-obs pairs for each variable. Finally, the script updates the project_log with summary information for the mm5Example project.

Note that if your MM5 simulation was configured to use a non-PX surface model, you will need to change both the variables \$diagnose_sfc and \$match_config in the populate_project.input file; see Appendix B for more information.

6.3 The agExample Project

Go to the project directory:

```
$ cd $AMETBASE/scripts db/agExample
```

Here, you will see two input files, one C-shell script, and the combine subdirectory. The setup_project.input file is the input file for initializing the project's database table (discussed later in Section 6). The only thing that you should need to change in this file is the "\$email" variable. Note that you should use the backslash "escape" character, "\", to prevent Perl from evaluating the "@" in your e-mail address. The populate_project.input file describes specific flags for the model outputs and observations that you want to process. See Appendix B for information on the specifics relating to each variable. You will likely not need to change anything in this second input file. The combine directory is not used for this example; it is discussed later in Section 6.5, "Creating a New AQ Project".

The C-shell file aqProject.csh is a wrapper script for calling the Perl programs that actually populate the AMET database with the project data. The variable that you will likely change for this project is "AMETBASE". Run the script by typing

```
$ ./aqProject.csh >& log.populate
```

Note that if you are overwriting an existing project (i.e., using the same project name), you cannot redirect the screen output to a file because the script will require input from you.

This C-shell script will create one empty project table in the AMET database: aqExample. After creating this table, the script then begins the matching process. This consists of calling a series of Perl programs and Fortran helper programs. The two Fortran helper programs are \$AMETBASE/bin/cmp_airs.exe and \$AMETBASE/bin/sitecmp.exe; the first one matches the AQS data to the nearest grid cell in the CMAQ model, and the second one does the

same for the other networks. After each network has been matched to the model, the aqExample table is populated with the model-obs pairs. In addition to creating and populating the aqExample table, the script updates the project_units table with each network for that project. This table defines the physical units of the species variables for this network (e.g., ppb vs. μ g/m³). Finally, the script updates the aq_project_log with summary information for the aqExample project.

6.4 Creating a New MET Project

When you create your own projects, we recommend that you utilize the structure of naming your directories after your projects. If you choose not to do this, you will have to modify the provided run scripts.

To create a new project, follow these basic steps:

- 1. Copy the appropriate example project to a new directory.
- 2. Rename it after your new project (use the *exact* project name, as many scripts use the project name to navigate directories).
- 3. Create a new project directory under \$AMETBASE/model_data/MET for the input model data.
- 4. Create a new project directory under \$AMETBASE/output.
- 5. Change the appropriate variables in the project C-shell script.
- 6. Run your new populate script

For example, if we were creating a new WRF project called "wrfNC2007", we would use

```
$ cd $AMETBASE/scripts_db
$ cp -r wrfExample wrfNC2007
$ cd wrfNC2007
```

Create a new model data directory and move or link your model data into it, as follows:

```
$ cd $AMETBASE/model_data/MET
$ mkdir wrfNC2007
$ cd wrfNC2007
$ ln -s <model data> .
```

Here, you would replace "<model data>" with the path to your model data file(s). The metProject.csh script will perform the model-obs matching on all model outputs in this new directory.

Create a new output directory for this project, using

```
$ cd $AMETBASE/output
$ mkdir wrfNC2007
```

Next, edit the \$AMETBASE/script_db/wrfNC2007/metProject.csh variables AMET_PROJECT ("wrfNC2007") and AMET_PROJ_DESC (your description of the project).

Finally, run the populate script:

```
$ cd $AMETBASE/scripts_db/wrfNC2007
$ ./metProject.csh
```

This will create a new MET project in the amet database. Specifically, it will create a new row in your project_log table and three new tables: wrfNC2007_profiler, wrfNC2007 raob, and wrfNC2007 surface.

6.5 Creating a New AQ Project

Before describing the creation of a new AQ project, we need to clarify a potentially confusing issue: the relationship between model species and monitor species. In order for AQ database population to work, there must be a mapping between the model species and the various network species. This mapping is accomplished by postprocessing the CMAQ model data, and through species definitions in the populate_project.input file. The model data used in the aqExample section (Section 6.3) were already postprocessed, and thus we did not need to go through that step when running the example project. In a new project, you will likely need to postprocess your CMAQ data before they are ingested into the amet database. This postprocessing is accomplished in the third step of creating a new AQ project (see below), using the combine Fortran program.

Also, when you create your own projects, we recommend that you utilize the structure of naming your directories after your projects. If you choose not to do this, you will have to modify the provided run scripts.

To create a new project, follow these basic steps:

- 1. Copy the appropriate example project to a new directory.
- 2. Rename it after your new project (use the *exact* project name).
- 3. Postprocess the model data using the combine Fortran program.
- 4. Create a new project directory under \$AMETBASE/model_data/AQ for the input model data.
- 5. Create a new project directory under \$AMETBASE/output.
- 6. Change the appropriate variables in the project C-shell script.

7. Run the new populate script.

For example, if we were creating a new AQ project called "aqNC2007", we would use

```
$ cd $AMETBASE/scripts_db
$ cp -r aqExample aqNC2007
```

Next you will need to postprocess the raw CMAQ concentration and wet deposition files to the appropriate species names. To do this, you will use the combine Fortran program. Go to the combine directory:

```
$ cd aqNC2007/combine
```

Edit the combine_conc.csh and combine_dep.csh scripts for your model data. For detailed instructions on combine, see

http://www.cmascenter.org/help/model_docs/cmaq/4.6/EVALUATION_TOOLS.txt. Run the two combine scripts:

```
$ ./combine_conc.csh
$ ./combine_dep.csh
```

Regarding the populate_project.input file, you will not need to change it if you do not change the species definition files (spec_def*). If you do change the species definitions, you will need to change the species definitions and names in the \$AMETBASE/scripts_db/aqNC2007/populate_project.input. See Appendix B for details.

Next, create a new model data directory and move or link your postprocessed model data into it, as follows:

```
$ cd $AMETBASE/model_data/AQ
$ mkdir aqNC2007
$ cd aqNC2007
$ ln -s <model data> .
```

Here, you would replace "<model data>" with the path to your postprocessed model data file(s). The aqProject.csh script will perform the model-obs matching on all model outputs in this new directory.

Create a new output directory for this project, using

```
$ cd $AMETBASE/output
$ mkdir aqNC2007
```

Then in the file \$AMETBASE/scripts_db/aqNC2007/aqProject.csh, edit the variables AMET_PROJECT ("aqNC2007"), START_DATE (start date of the model data), END_DATE (end date of the model data), CONC_1 (model concentration file(s)), and DEP_1 (model deposition file(s)). Note that the model data files should point to your postprocessed model data.

Finally, run the populate script:

```
$ cd $AMETBASE/scripts_db/aqNC2007
$ ./aqProject.csh
```

This will create a new AQ project in the amet database. Specifically it will create a new row in your aq_project_log table, a series of new rows (one for each network) in your project units table, and a new project table: aqNC2007.

7. Analysis

The analysis phase of AMET consists of performing statistics on the model-observational pairs and creating plots of these statistics. The basic process is to query the project's database table(s) using a set of SQL criteria, to perform statistics on the returned data, and to create plots, tables and text file outputs. The current AMET package contains a series of preprogrammed statistical analyses and plotting routines, based on the R language. These prepackaged scripts are provided strictly as a starting point and as illustrative examples. Because all the model-obs pairs are stored in a MySQL database, an advanced user can decide to access that data in any desired manner, including other software packages. All that is required is a MySQL interface and some exploration of the table structure. We encourage advanced users to extend these R scripts to create more specific or advanced plotting capabilities, to use other languages to expand AMET analysis capabilities, and to contribute these updates to the CMAS community.

As with the database populate phase, the project is the organizing structure that we use to group a particular model run (specific model, physics or chemistry, spatial domain, scale, etc.) with the scripts used to analyze the amet tables and with the output from this analysis (plots and data).

A second organizing structure is the grouping of three files for each type of analysis. In the project directories, you will see a C-shell script and an input file with similar names (e.g., run_timeseries.csh and timeseries.input). These two files set up everything that is necessary to run an underlying R script in \$AMETBASE/R and then run that script. The use of the C-shell interface allows users who are not very familiar with R to perform these predefined analyses, shielding them from the actual R code.

7.1 wrfExample

Go to the project directory:

```
$ cd $AMETBASE/scripts analysis/wrfExample
```

Here, you will see a series of C-shell scripts and their accompanying input files. We will go through an analysis script in detail as an example for running each of the scripts in the project.

The run_spatial_surface.csh script creates a series of maps comparing the surface monitors to the model for one or more days. Each plot provides color-coded model performance metrics at each of the monitor locations. In each map, it plots the particular value at the monitor

location.

First, edit the <code>run_spatial_surface.csh</code> file. Change the AMETBASE variable to correspond with your setup. The corresponding input file, <code>spatial_surface.input</code>, will likely not need to be changed.

Run the script:

\$./run_spatial_surface.csh

This will print a whole series of R commands and stdout values to the screen. After it has completed, go to the output directory and view your maps:

\$ cd \$AMETBASE/output/wrfExample

You should see a whole series of plots of the form:

wrfExample.<stats>.<variable>.20020705.20020709.pdf

A brief summary of each of the C-shell scripts:

Table 7-1. MET analysis scripts.

C-shell Script	Input	Description
run_met_aq .csh	<pre>met_aq_coupled .input</pre>	Compares AQ and MET data. Creates a spatial plot of correlation and a timeseries plot of bias. <i>Note</i> : you need to setup both MET and AQ models and define the MET variables and the AQ species and network of interest.
run_spatial_surface .csh	spatial_surface .input	Creates a series of maps comparing surface monitor and model values for one or more days.
run summary .csh	summary .input	Creates a summary plot of a series of MET variables. This includes a timeseries plot and an "ametplot" that includes a scatterplot, timeseries, boxplot, and for wind direction, a histogram and directional scatterplot. Note that the user may want to change the variable AMET_RUNID to change the file naming convention. Also, the AMET_CRITERIA is an additional SQL command that further limits the data used. This can be customized by the user.

C-shell Script	Input	Description
run timeseries	timeseries .input	Creates a timeseries plot for one or more monitoring stations. Creates a timeseries plot for temperature, mixing ratio, wind speed and direction. You control which monitors are plotted through the AMET_SITEID variable. You can also control date ranges and provide additional SQL criteria to further limit the data. <i>Note</i> : multiple sites can either be averaged or used to create separate plots.
run daily barplot	daily barplot .input	Creates a series of daily barplots for all sites within your domain.
run plot prof	plot prof .input	Creates time-height maps of wind direction and speed profiles statistics.
run plot raob	plot raob .input	Creates plots of rawinsonde sites. It creates a series of maps of all sites and vertical profile for user specified site.
run wind prof	wind prof .input	Creates wind arrow profiles for a set of specific monitoring sites.

Under the \$AMETBASE/scripts_analysis directory, you will notice that there is only a wrfExample project on the MET side. We did not include the mm5Example because the two models are basically treated the same in terms of analysis. You could easily add a new project directory for mm5Example by following the instructions in Section 7.3.

7.2 aqExample

Go to the project directory:

\$ cd \$AMETBASE/scripts analysis/aqExample

Here, you will see a series of C-shell scripts and their accompanying input files. We will go through an example analysis script in detail as a model for running each of the scripts in the project.

The run_scatterplot.csh script creates a scatterplot for one species from one or more monitoring networks. It compares the observed values to the corresponding model values. The AQ side has an added complication – not all monitoring networks monitor all species. Therefore, the user needs to know which network has which species; if the species is not available in the network, the analysis scripts will likely fail. See Section 4.2 and Appendix B for more details on

the various species that are monitored (or available) from each AQ network.

First, edit the run_scatterplot.csh file. Change the AMETBASE variable to correspond with your setup. Note that the species selected is SO4 and you are plotting 2 networks: IMPROVE, and CASTNET. The corresponding input file, scatterplot.input, will likely not need to be changed.

Run the script:

\$./run scatterplot.csh

This will print a whole series of R commands and stdout values to the screen. After it has completed, go to the output directory and view your plot:

\$ cd \$AMETBASE/output/agExample

You should see files of the form:

aqExample SO4 scatterplot.pdf

A brief summary of each of the C-shell scripts is included below:

Table 7-2. AQ analysis scripts.

C-shell Script	Input	Description	Scope
run boxplot .csh	boxplot .input	Creates a box plot of model- obs quartiles. Designed for an entire year of data. Can be used with a period as short as 3 months.	single network; single species; single simulation
run boxplot hourly .csh	boxplot hourly .input	Creates side-by-side boxplots to create a diurnal average curve. Hourly data only.	single network; hourly species only; single simulation
run bugleplot .csh	<pre>bugleplot .input</pre>	Model performance criteria are adjusted as a function of the average concentration of the observed value for that species. As the average concentration of the species decreases, the acceptable performance criteria increase. Creates a bias and error plot.	multiple networks; single species; single simulation

C-shell Script	Input	Description	Scope
run met aq .csh	met aq coupled .input	Compares AQ and MET data. Creates a spatial plot of correlation and a timeseries plot of bias. Note that you need to setup both MET and AQ models and define the MET variables and the AQ species and network of interest.	AQS; O ₃ ; single MET/AQ simulation pair
run pave overlay .csh	pave overlay .input	Creates a data file that can be used by the program bldoverlay to create an overlay file. This file can be used in PAVE to overlay over CMAQ model output. Hourly data only.	single network; hourly species only; single simulation
run plot spatial .csh	plot spatial .input	Plots the observed value, model value, and difference between the model and obs for each site. Multiple values for a site are averaged to a single value for plotting purposes.	multiple networks; single species; single simulation
run scatterplot .csh	scatterplot .input	Creates a single model vs. obs scatterplot. This script will plot a single species from up to three networks on a single plot. Summary statistics are also included on the plot.	multiple networks; single species; multiple simulations
run scatterplot MtoM	scatterplot MtoM .input	Creates a single model-to-model scatterplot. <i>Note</i> : the model points correspond to network's site locations only.	multiple networks; single species; multiple simulations
run scatterplot single .csh	scatterplot single .input	Creates a scatter plot for a single network that includes more specific statistics than run_scatterplot.csh.	single network; single species; multiple simulations

C-shell Script	Input	Description	Scope
run scatterplot skill .csh	scatterplot skill .input	Creates a forecast skill scatter plot. The script is designed to work specifically with O ₃ .	all AQS networks; O ₃ ; single simulation
run soccerplot	soccerplot .input	Creates a soccerplot for one or more species over one or more networks. Criteria and goal lines are plotted in such a way as to form a "soccer goal" on the plot area. Two statistics are then plotted, Bias [NMB (normalized mean), FB (fractional), or NMdnB (normalized median)] on the x-axis and Error [NME(normalized mean), FE(fractional), or NMdnE(normalized median)] on the y-axis. The better the performance of the model, the closer the plotted points will fall within the "goal" lines.	multiple network; multiple species; multiple simulations
run stacked barplot .csh	stacked barplot .input	Data are averaged for SO ₄ , NO ₃ , NH ₄ , EC, OC and PM _{2.5} for the model and observed values. Averages are then plotted on a stacked bar plot, along with the percent of the total PM _{2.5} that each species comprises.	STN or SEARCH; species predefined; multiple simulations
run stats plots	stats plots .input	Generates a series of spatial plots of NMB, NME, FB, FE and Correlation. CSV files with additional domain and site specific statistics are included as well.	multiple networks; single species; single simulation

C-shell Script	Input	Description	Scope
run timeseries	timeseries .input	Creates a timeseries plot. With multiple sites, the sites are time averaged to create a single plot. Also plots the bias and error between the obs and model.	

7.3 Creating a New Project

Creating a new project requires the same basic steps for the MET and AQ models. When you create your own projects, we recommend that you utilize this same structure of naming your directories after your projects. In order to run analysis, you must already have populated the database with the new project, see Section 6.4 and 6.5. To create a new analysis project, follow these basic steps:

- (1) Copy the appropriate example project to a new directory.
- (2) Rename it after your new project (use the *exact* project name, as many scripts use the project name to navigate directories).
- (3) Change the appropriate variables in the project C-shell script
- (4) Check that a new project directory under \$AMETBASE/output exists.
- (5) Run your analyses scripts.

For example, if we were creating a new WRF project called "wrfNC2007":

- \$ cd \$AMETBASE/scripts analysis
- \$ cp -r wrfExample wrf \overline{N} C2007
- \$ cd wrfNC2007

In each of the C-shell scripts that you want to run, make sure you change the AMET_PROJECT to wrfNC2007. You will also likely change dates and custom titles in many of the scripts.

Check that the output directory, \$AMETBASE/output/wrfNC2007 exists. If not, create it:

\$ mkdir \$AMETBASE/output/wrfNC2007

Run the desired analysis scripts from your new project directory.

8. CMAS Support for AMET

We have added AMET to Bugzilla, the CMAS bug-tracking and support request software system. You are encouraged to contact CMAS via bugzilla if you have bugs to report, or if you seek assistance with a specific component of AMET. The Bugzilla site for AMET is http://bugz.unc.edu/enter_bug.cgi?product=AMET. If you have never accessed this site before, a user-account needs to be created by sending an email request to the CMAS administrator. We have created the following sub-sections on the Bugzilla AMET page:

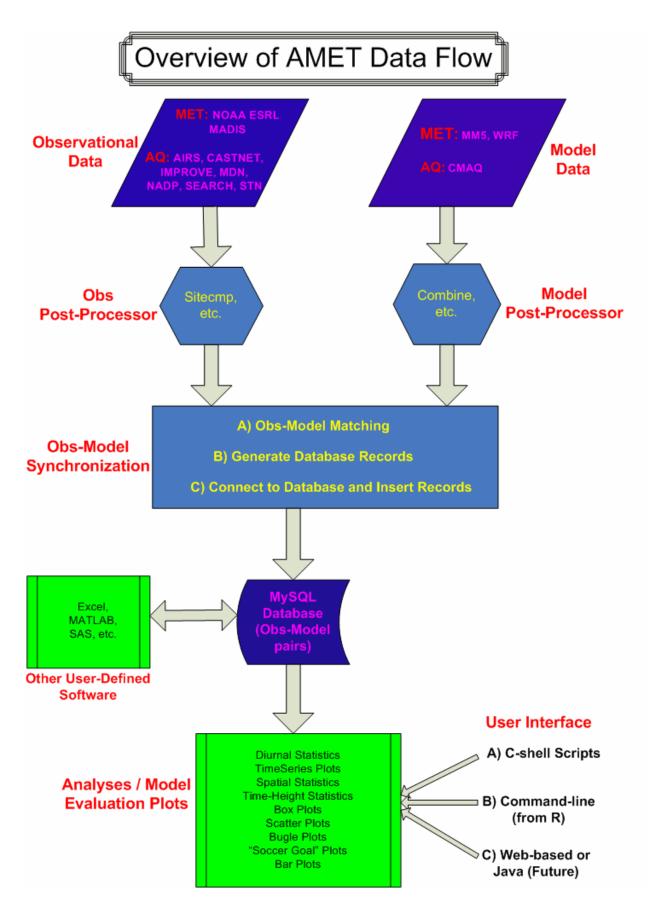

- AQ Analyses
- AQ Database
- Installation
- Met Analyses
- Met Database
- Other

Appendix A: Overview Flow Diagram

Appendix B: Configuration and Input Files

B.1 Perl Configuration File

This is the configuration file for all Perl scripts used in database population. E.g., SAMETBASE/configure/amet-config.pl

Table B-1. amet-config.pl

Variable	Description
<pre>\$amet_base</pre>	Top of AMET directory tree. We recommend that you keep this as the value of the environmental variable \$AMETBASE , otherwise the provided scripts will need significant modification.
<pre>\$mysql_server</pre>	MySQL server location. Examples are "localhost" for the same machine as AMET, or "rama.cempd.unc.edu" for a server on rama.
<pre>\$root_login</pre>	MySQL user for adding data to the database and performing queries. We recommend "ametsecure". This user will be created in the database setup. Note: To increase system security, users may want to restrict this configuration file to read and write only by user.
<pre>\$root_pass</pre>	Password for "ametsecure", or your \$root login (if changed from "ametsecure"). This user will be created in the database setup
\$dbase	The name of the MySQL database created for all AMET projects. We recommend "amet".
<pre>\$perl_lib</pre>	Location of additional Perl libraries. In our example, we added additional libraries through CPAN to "/usr/local/lib/perl". Below \$perl_lib is the version number directory and below that are the additional modules.
\$R_dir	Base directory for R installation.
\$R_exe	Full path to R executable.
\$R_lib	All of the R library paths that should be searched. In our example, "/usr/local/pkgs/Rpackages:\$R_dir/lib/R/site-library", we installed additional R libraries under /usr/local/pkgs/Rpackages.
\$EXEC_aqs	Full path to cmp_airs executable
\$EXEC_all	Full path to sitecmp executable

Variable	Description
\$fslftp_madis	MADIS ftp site (only needed if using MET side)
\$login_madis	MADIS provided login (MET side only)
\$pass_madis	MADIS provided password (MET side only)
\$fslftp_ncep	NCEP ftp site (only needed if using MET side)
<pre>\$login_ncep</pre>	NCEP login - most likely "anonymous"
\$pass_ncep	Anonymous password for NCEP, usually your email address. Note the necessary "\@" (MET side only)
<pre>\$amet_verbose</pre>	Verbose stdout. "yes" for more verbose, "no" for less verbose.

B.2 R Configuration File

This is the configuration file for all R-based analyses scripts. Note that the values here should likely match the equivalent values in the Perl configuration file. E.g., \$AMETBASE/configure/amet-config.R

Table B-2. amet-config.R

Variable	Description
server	MySQL server location. Examples are "localhost" for the same machine as AMET, or "rama.cempd.unc.edu" for a server on rama.
login	The name of the MySQL database created for all AMET projects. We recommend "amet"
passwd	Password for ametsecure, or your login if changed. This user will be created in the database setup and should reflect the Perl configuration file.
dbase	The name of the MySQL database created for all AMET projects. We recommend "amet".
maxrec	Maximum number of records to extract from the database for any one query. No maximum $=$ -1 .
Bldoverlay_exe	The location of the bldoverlay Fortran executable. Most likely \$AMETBASE/bin/bldoverlay. (AQ only)
R_dir	Base directory for R installation.
R_exe	Full path to R executable.
R_lib	All of the R library paths that should be searched. In our example, "/usr/local/pkgs/Rpackages:\$R_dir/lib/R/site-library", we installed additional R libraries under /usr/local/pkgs/Rpackages.

B.3 MET Project Setup Input File

This is the MET input file for all new projects, and sets up an empty project. E.g., \$AMETBASE/scripts_db/wrfExample/setup_project.input

Table B-3. MET setup_project.pl

Variable	Description
<pre>\$run_id</pre>	Project name. Must be unique across both MET and AQ project names.
\$model	MET model. Example "mm5" or "wrf"
\$login	Your username. Identifier used to populate user column in project_log table.
\$email	Your email. Note: use the backslash character "\" to escape the "@" character for Perl.
\$description	Brief project description

B.4 AQ Project Setup Input File

This is the AQ input file for all new projects, and sets up an empty project. E.g., \$AMETBASE/scripts_db/aqExample/setup_project.input

Table B-4. AQ setup_project.input

Variable	Description
<pre>\$run_id</pre>	Project name. Must be unique across both MET and AQ project names.
\$model	AQ model. Example "CMAQ"
\$login	Your username. Identifier used to populate user column in aq_project_log table.
\$email	Your email. Note: use "\" to escape the "@" character for Perl.
\$description	Brief project description
\$delete_id	Delete project if project already exists. "y" - yes, delete project, with prompt "n" - no, do not delete project
\$exit_exists	Returned exit status of AQ_create_project.pl if project exists: 1 - return error 0 - return success

B.5 MET Project Populate Input Files

This is the MET input file for populating new projects. E.g., \$AMETBASE/scripts db/wrfExample/populate project.input

Table B-5. MET populate_project.input

Variable	Description
\$pid	Project name. Must be unique across both MET and AQ project names.
\$model	MET model. Example "mm5", "wrf", or "eta"
<pre>\$obs_format</pre>	Observation format: "madis" - MADIS observations "tdl" - preprocessed non-standard obs
<pre>\$model_data_dir</pre>	Directory of model output
<pre>\$obs_dir</pre>	Top of observation directory. For MADIS this is the equivalent of \$TOP and \$MADIS_DATA. For typical setup, this will be \$AMETBASE/obs/MET
<pre>\$tmp_dir</pre>	Output directory for temporary MADIS files and MM5 netCDF files.
<pre>\$interp_method</pre>	Interpolation technique from model grid to observation location: 0 - bilinear 1 - nearest neighbor
\$eval_class	Observation types to include: "surface" - surface observations only "profiler" - wind profiler only "raob" - rawinsonde only "all" - all observation types
\$diagnose_sfc	Diagnose surface model: 1 - MM5 with PX surface model 0 - WRF or MM5 without PX surface model Note that if you use 0 for MM5, then you need to change \$match_config to non-PX configuration
\$match_initial	This variable has been deprecated, see \$time_index_start

Variable	Description
<pre>\$output_int</pre>	Model output time step in hours.
<pre>\$eval_int</pre>	Observations time step in hours.
\$forecast	Model is a forecast, hence observations may not be available for all hours: 1 – yes (forecast hour is set to time index in model output × output interval) 0 – no (forecast hour is set to zero)
<pre>\$auto_ftp</pre>	Automatically ftp observations from MADIS: 1 - yes 0 - no
<pre>\$time_index_start</pre>	Starting index of model output. This can be used to skip a spin-up period. The starting point is index + 1. Example values: -1 - start at 0th hour, i.e. include all timesteps 0 - skip first time step, start at hour 1 11 - start at hour 12
<pre>\$process_npa</pre>	Match model precip with National Precipitation Analysis (not supported at this time) 1 - yes 0 - no
<pre>\$real_time</pre>	Real time run, use current system date as time range in scripts: 1 - yes 0 - no
\$file_date	For MM5 data, model data needs to be in netCDF format or converted to netCDF. If it has been converted, it needs to use the naming convention mmout.YYYY.MM.DD-NHRS. For example, mmout.2001.04.01.00-48 is a model run starting at 4/1/2001 0 UTC and running for 48 hours. MM5 has already been converted to netCDF: 1 - yes 0 - no

Variable	Description
<pre>\$rm_output_file</pre>	Remove model output file after matching process: 1 - yes 0 - no
<pre>\$match_config</pre>	Full path to configuration file for matching MADIS variables to model variables. Note that if you are using MM5 with a nonPX surface model, you will have to use MET_matching_nonPX.conf and change the \$diagnose_sfc value to 0

B.6 AQ Project Populate Input Files

This is the AQ input file for populating new projects. E.g., \$AMETBASE/scripts_db/aqExample/populate_project.input

Table B-6. AQ populate_project.input

Variable	Description
\$start_date	Start date of model-observation matching.
\$end_date	End date of model-observation matching.
\$m3_file[i]	Array of model output file(s). Up to 6 model concentration files.
<pre>\$m3_dep_file[i]</pre>	Array of model output file(s). Up to 6 model wet deposition files.
<pre>\$project_id</pre>	Project name. Must be unique across both MET and AQ project names.
<pre>\$castnet_flag</pre>	Example of monitoring network flag (CASTNET). Each network can be either included or excluded: "y" - include monitoring network's observations "n" - exclude monitoring network's observations
\$03_units	Concentration units for model O ₃ : "ppb" or "ppm"
<pre>\$precip_units</pre>	Precipitation units in model: "cm" or "mm"
<pre>\$inc_rh</pre>	Include relative humidity: "y" - "yes" include RH "n" - "no" do not include RH
<pre>\$user_def_spec</pre>	Additional or different definition for chemical species: "y" - user providing new definitions "n" - user is not providing new definitions
\$ozone	Example of specific species to be user-defined. For all species that use the default definitions, set them to "n". If user-defined, set that species to "y", and change the respective species name.

Variable	Description
\$03_conc_name	User defined species. Used by sitecmp or cmp_airs to translate between model variables and monitor variables. Only used if respective species is set to user defined ("y"). For example total carbon (TC_conc_name) is being defined as AECT + PM_OC.

B.7 MET Analysis Input Files

The analysis input files are found in \$AMET/scripts_analysis/wrfExample. The following is a partial list of variables. Not all of these variables are available in every input file.

Table B-7. MET analysis input variables

Variable	Description
ametp	Flag to generate figures.
aq_database	Name of air quality database. This is typically the same as the meteorological database (e.g., "amet")
aq_network	Air Quality Network to be plotted. Default from csh script.
aq_project	Air Quality project to be used. Default from csh script.
aq_site_table	Table in AMET database that contains metadata of air quality sites.
aq_species_col	Air Quality variables to be included in analysis. Default value is from csh script.
checksave	Check to see if R datafile exists (i.e., if savefile is activated R datafile is saved, so there is no need to query database)
colp	Various color specifications for model evaluation metrics
colpT	Color specifications for model evaluation metrics involving 2-m temperature
colpWS	Color specifications for model evaluation metrics involving 10-m wind
convert	ImageMagick command. Used to crop margins of images. This variable has been deprecated.
colpRH	Color specifications for model evaluation metrics involving relative humidity

Variable	Description
date	Either one date used as both starting and ending date (default from csh script) or a vector containing starting and ending dates. Format: YYYYMMDD
	In met_aq_coupled.input used to select ending date of analysis. Default uses value from csh script.
datee	In summary.input used in the plot header to show the ending date used in the analysis. Does not change dates used in analysis.
	Format: YYYYMMDD
	In met_aq_coupled.input used to select starting date of analysis. Default uses value from csh script.
dates	In summary.input used in the plot header to show the starting date used in the analysis. Does not change dates used in analysis.
	Format: YYYYMMDD
daydelay	Used in real-time mode to lag statistics by daydelay days.
de	Ending day of timeseries analysis. Default uses value from csh script
diurnal	Flag to patition and plot statistics as a function of time of day.
ds	Starting day of timeseries analysis. Default uses value from csh script
dstatloc	Vector of indices of statistics to plot (user should not need to modify)
elev	Elevation criteria
extra	Additional SQL criteria to use in database query

Variable	Description
extra2	Additional SQL criteria to use in database query. This is for the second site in timeseries plot
fcasthr	Forecast hour criteria used to isolate a particular segment of forecast data.
fcasthrstr	Forecast hour string used in query
figdir	Directory where figures will be output. Default value comes from the csh script.
figid_sub	Secondary figure label
figure	Full figure path and name
fixed.legend	FALSE – Use default legend TRUE – Use custom legend from legend.interval
he	Ending hour of analysis.
histplot	Flag to plot histogram of statistics.
Hloc	Column of query data where height is located
hs	Starting hour of analysis.
infolab	Various profile labels
infolabProf1	Various profile labels
infolabProf2	Various profile labels
infolabProf3	Various profile labels
landuse	Landuse classification criteria for MySQL query
lat	Latitude specification for MySQL query
layer	Layer specification for profiler statistics.
layerlab	Label for specified layer

Variable	Description
layerunit	Units for layer statistics
layervar	Variable for layer statistics
legend.div	Number of Legend intervals
legend.interval	Specific legend intervals
legend.interval.bias	Legend intervals for mean bias
level	Level description
levelsT	Levels for temperature statistics
levsRH	Levels for relative humidity statistics
levstr	Level-based query string
levsWS	Levels for wind speed statistics
lon	Longitude specification for query
LT.offset	Maximum and minimum UTC to local time offset in domain.
mainstr2	Secondary plot title string
max.dist	Maximum distance allowed between AQ and MET sites in km.
maxrec	Maximum number of records to allow from database query (set to -1 for unlimited)
me	Ending month of analysis, default comes from csh run script.
met_database	MySQL database name which holds meteorological project.
met_network	Meteorological network
met_project	Meteorological project name to be used in analysis. Default uses value from csh script.

Variable	Description
met_site_table	Name of the table which contains meteorological site information.
met_variable_col	Modeled and observational variables of interest. Should be column names from database.
metric	Vector of metric identification (i.e., bias, mae, etc)
model	AMET project name
model1	Primary AMET project for timeseries plot
model2	Secondary AMET project for timeseries plot
ms	Starting month of analysis default comes from csh run script.
Name	Description
nvar	Number of variables
obnetwork	Network used in analysis. This value is only used in the plot header, and does not affect the analysis.
obtime	Times used in analysis. This value is only used in the plot header, and does not affect the analysis.
otime	Observation time of day
PBLloc	Location of PBL height in data array
pheight	Plot height in pixels
pid	A separate identification which is attached to the output. Can be used to distinguish between different output subsets for the same project. Default value is input from the csh script.
player	Logical to plot layer statistics
plotfmt	File type of output. Default is taken from the csh script. Acceptable Values: png, pdf, jpg, or eps

Variable	Description
plotopts	List of plot options which include values set in plotfmt, plotsize, symb, and symbsiz.
	Scale factor to increase or decrease the size of plots.
plotsize	1 = 541 x 700 pixel (png) or 8.5 x 11 inch (pdf)
processprof	Logical to generate profile comparisons
prof	Logical (T or F) for plotting raob-model profile comparison
proflim	Lower and upper limit of profile plot
project	AMET Project name to be used in analysis. Default value is taken from csh run script.
pwidth	Width of plot
qclims	List which includes QC/QA limits for T, WS, and Q set in qcT, qcQ, and qcWS.
qcQ	Quality control limits of moisture data (Note: all data outside of this range is not considered)
qcT	Quality control limits of temperature data
qcWS	Quality control limits of wind speed data
query	MySQL query
queryID	A separate identification which is attached to the output. Can be used to distinguish different output subsets for the same project. Default value is transferred from pid.
querystr	Additional SQL criteria that can be used to subset the data used by the analysis. Default value is transferred from the run script.
realtime	Run script in real-time automated mode
savedir	Directory in which plots and other output will be saved. Default value is input from csh script.

Variable	Description
savefile	Logical to generate a R data file that contains the data use in the statistics plots
saveid	Name of R data file
scex	Scale factor for statistics text size
sfctable	Name of projects surface data table to be used in analysis.
sfixed	This variable has been deprecated
sget	Index of spatial statistics to plot
shadeplot	Flag to plot shaded statistics plot in addition to point statistics plot.
SNRloc	Location of signal to noise ratio in data array
spatial	Logical to plot spatial surface statistics
sres	Resolution of shaded plot in degrees.
statAbr	ID of statistics
statid	In timeseries_plot, the site ID to be used in the analysis. Default value is taken from the csh script.
	In summary_plot , the station label to be used in labeling the plot.
statloc	Location of statistic in array
statname	Name or ID of statistic
statstr	Station criteria string used in MySQL query
symb	Symbol shape to be used in plots. See R documentation for shape numbers.
symbo	Plot symbol

Variable	Description
symbsiz	Scale factor to adjust size of symbols on plots. 0.5 is very small while 1.5 is large.
syncond	This variable has been deprecated.
t.test.flag	Logical to apply statistical significance test to the spatial statistics. If applied and model and observation data are not different statistically, the values are not plotted
table	Database table
textout	Logical to write text output of statistics and underlying data
textstats	Logical to write text file of statistics
thresh	Used in spatial surface to identify the minimum number of datapoints required at a particular site to compute the statistics
time.of.day.utc	Range of time (UTC) to isolate met and aq data (i.e., compare average temperature and average PM for hours between 6 and 12 UTC)
timeserieslen	Used in real-time mode to lag statistics by tserieslen days.
Tloc	Index location of temperature in data array
tserieslen	Length in days of time series if real-time mode is activated
Uloc	Index location of U-wind component in data array
uniquepnum	Unique plot number (random)
var	variable
varAbr	Variable abbreviation
varcri1	Variable criteria for primary MySQL query
varcri2	Variable criteria for secondary MySQL query

Variable	Description
varid	Variable ID
varloc	Variable location in array (column location)
varunits	Units of variable
varxtrac1	MySQL query string segment that identifies what variables are extracted from the database (primary query)
varxtrac2	MySQL query string segment that identifies what variables are extracted from the database (secondary query)
varxtract	This variable has been deprecated
vfixed	This variable has been deprecated
vget	Vector of variable index to plot
Vloc	Index location of V-wind component in data array
wantfigs	Flag to generate figures
wantsave	Flag to save station statistics data in R data file
wdweightws	Logical to weight wind direction statistics by the wind speed (e.g., if wind speed falls below 3 m/s the difference between model and observed wind direction is mitigated)
ye	Ending year of analysis default comes from the csh script.
ys	Starting year of analysis default comes from the csh script.
zlims	Specification of lower and upper vertical level of profile

B.8 AQ Analysis Input Files

The analysis input files are found in \$AMET/scripts_analysis/aqExample. The following is a partial list of variables in the AQ analysis input files. Not all of these variables are available in every input file.

Table B-8. AQ analysis input variables

Variable	Description
add_query	Additional query syntax to add to the MySQL query.
aq_database	AQ MySQL database. Most likely "amet".
aq_network	AQ monitoring network.
aq_project	AQ project name.
aq_site_table	AQ monitoring site MySQL table. Most likely "site_metadata".
aq_species_col	AQ variables, column names, from AQ project table.
averaging	Average across time: "n" = no averaging (default); "s" = seasonal averaging (DJF; MAM; JJA; SON); "m" = monthly averaging; "a" = entire time period averaging
axis_max_limit	Axis (x and y) max limit: "NULL" – script defined limit
axis_min_limit	Axis (x and y) min limit: "NULL" – script defined limit
bias_range_max	Bias range max limit: "NULL" – script defined limit
bias_range_min	Bias range min limit: "NULL" – script defined limit
conf_line	Add confidence lines to scatterplots: "y" or "n".
coverage_limit	% necessary for data completeness, e.g., 75 means 75% data completeness.

Variable	Description
custom_title	Custom title for plots: "" - no custom title
datee	End data of query, YYYYMMDD format (met_aq_coupled.input only).
dates	Part of title label for non-custom labels, often set to year.
	Start data of query, YYYYMMDD format (met_aq_coupled.input only)
diff_range_max	Difference range max limit: "NULL" – script defined limit
diff_range_min	Difference range min limit: "NULL" – script defined limit
end_date	End data of query, YYYYMMDD format.
end_hour	End hour of query, HH format
error_range_max	Error range max limit: "NULL" – script defined limit
figdir	Output directory for plots.
fixed.legend	Fixed legend intervals (met_aq_coupled.input): "F" - False, use full range of data "T" - True, specify custom legend through legend.interval
inc_airmon_dep	Include AIRMoN "network": "y" or "n".
inc_all	Include all networks
inc_aqs_1max	Include AQS 1-hr max "network": "y" or "n".
inc_aqs_1max_9cel1	Include AQS 1-hr max 9 cell average "network": "y" or "n".
inc_aqs_8max	Include AQS 8-hr max "network": "y" or "n".
inc_aqs_8max_9cell	Include AQS 8-hr max 9 cell average "network": "y" or "n".
inc_aqs_hourly	Include AQS hourly "network": "y" or "n".

Variable	Description
inc_castnet	Include CASTNET "network": "y" or "n".
inc_castnet_hr	Include CASTNET hourly O ₃ "network": "y" or "n".
inc_improve	Include IMPROVE "network": "y" or "n".
inc_nadp	Include NADP "network": "y" or "n".
inc_ranges	Included quartile ranges on box plots.
inc_search	Include SEARCH "network": "y" or "n".
inc_search_daily	Include SEARCH daily "network": "y" or "n".
inc_stn	Include STN "network": "y" or "n".
legend.div	Number of levels if a fixed interval is not specified
legend.interval	Custom legend interval (met_aq_coupled.input)
legend.interval.bias	Custom legend bias interval (met_aq_coupled.input)
LT.offset	Max and min UTC to LT offset in domain
max.dist	Maximum distance allowed between MET and AQ "buddy" sites. These "buddy" sites are used to compare MET and AQ results in met_aq_coupled.
met_database	MET MySQL database. Most likely "amet".
met_network	MET monitoring network.
met_project	MET project name.
met_site_table	MET monitoring site MySQL table. Most likely "stations".
met_variable_col	MET variables, column names, from AQ project table.
num_ints	The number of color intervals to use for spatial plots. The script will ultimately determine the number of intervals, but num_ints can be set to increase or decrease the number of intervals.

Variable	Description
overlay_opt	PAVE overlay times: 1 – hourly 2 – daily 3 – 1-hr daily max 4 – 8-hr daily max
pid	Project name, must be unique across both MET and AQ.
plot_colors	Scatter plot symbol colors for primary simulation.
plot_colors2	Scatter plot symbol colors for secondary simulation.
plotfmt	Plot format, output type "PDF" - pdf format "PNG" - png and pdf formats
plotsize	Scale factor to increase or decrease the size of a 541 x 700 pixel (png) or 8.5 x 11 inch (pdf) plot.
query	MySQL query to select data from db. In most cases, this is only part of the query. The complete query is constructed in the corresponding R script.
remove_negatives	Remove negative values: "y" or "n". default == "y"
remove_other	Remove "PM other" category from stacked bar plot analysis
rmse_range_max	RMS Error range max limit "NULL" – script defined limit
run_info_text	Include model run info as additional text to plots: "y" or "n"
run_name1	Project name, must be unique across AQ and MET.
run_name2	Second project name (allowed only in some scripts)
site	Monitoring sites to include: "ALL" - all sites Specific site id

Variable	Description
soccerplot_opt	Flag for soccer and bugle plot options: 1 - Normalized Mean Bias/Error 2 - Fractional Bias/Error
species	Chemical species to plot.
start_date	Start data of query, YYYYMMDD format.
start_hour	Start hour of query, HH format.
state	Plot label for indicating certain states. Note that you will need to use an additional query to actually subset the data to these states.
stat_file	File containing specific list of stations to analyze. User defined.
stats_flags	Flags to determine which statistics are included on the run_scatterplot.csh script. Up to five statistics can be included, and are indicated by a 'y'. Unused statistics are left blank. The order of the statistics flags is: index_of agreement (IA), correlation (r), RMSE, systematic RMSE, unsystematic RMSE, NMB, NME, Normalized Median Bias, Normalized Median Error, Mean Bias, Mean Error, Median Bias, Median Error, Fractional Bias, Fractional Error
symb	Plot symbol: 15 - square 19 - circle
symbo	Plot symbol
symbsiz	Plot symbol size: (0.5 very small to 1.5 large) We recommend 1 for most applications.
textstats	Produce text statistics file: TRUE or FALSE.
time.of.day.utc	Range of time (UTC) to isolate met and aq data (i.e., compare average temperature and average PM for hours between 6 and 12 UTC)
use_avg_stats	Use time averaged statistics: "y" or "n".

Atmospheric Model Evaluation Tool (AMET) User's Guide

Variable	Description
use_log	Use natural log transform: "y" or "n".
zeroprecip	Include zero precipitation obs: "y" or "n". (typically set to "n")

B.9 AQ Variables-Network Mapping

We provide below a mapping between monitoring networks, frequency (of observations), and chemical species that are included in the observed datasets, and which can be used in the model evaluation scripts. The units of all these variables are provided already in Section 4.2.

Table B-9. AQ networks, species, and frequency of observations

Network	Frequency	Chemical Species
IMPROVE	daily (every 3 rd day)	SO ₄ , NO ₃ , PM _{2.5} , EC, OC, TC
STN	daily (every 3 rd day)	SO ₄ , NO ₃ , NH ₄ , PM _{2.5} , EC, OC, TC
CASTNET	weekly (hourly O ₃)	SO ₄ , NO ₃ , NH ₄ , HNO ₃ , TNO ₃ , O ₃
NADP	Weekly accumulated	Wet deposition and concentration for SO ₄ , NO ₃ , NH ₄ and precipitation
SEARCH	hourly	O ₃ , CO, SO ₂ , NO, HNO ₄ , teom PM _{2.5} , NO ₃ , SO ₄ , NH ₄ , NOY
AQS	hourly	O_3
MDN	weekly	Wet deposition and concentration for Hg
