1. The FEST-C System

1.1 Introduction

The Fertilizer Emission Scenario Tool for CMAQ (FEST-C) (<http://www.cmascenter.org/fest-c/>; <https://github.com/CEMPD/FEST-C>) is a Java-based interface system that is used to simulate daily fertilizer application information using the Environmental Policy Integrated Climate (EPIC) model (<http://epicapex.tamu.edu/epic/>) and to extract the EPIC daily output that is a required input for bidirectional NH₃ modeling performed using the Community Multiscale Air Quality (CMAQ) modeling system (<http://www.cmascenter.org/cmaq/>). The FEST-C interface system and spatial data processing tools were developed by the University of North Carolina at Chapel Hill (UNC)'s Institute for the Environment, while EPIC model development for the FEST-C system was performed by Benson Consulting and EPA scientists. All work was performed under contract to the U.S. EPA Office of Research and Development.

The EPA EPIC implementation requires no previous estimates of fertilizer application; it estimates daily fertilizer applications based entirely on simulated plant demand in response to local soil and weather conditions. The FEST-C interface associates EPIC simulations spatially to the CMAQ domain and resolution through the current release of the Spatial Allocator (SA) Raster Tools system (<http://www.cmascenter.org/sa-tools/>) that has been developed under the Community Modeling and Analysis System (CMAS) Center. Figure 1 displays the process diagram of FEST-C linkage with the Weather Research and Forecasting (WRF) and CMAQ modeling system. The Biogenic Emissions Landcover Database version 4 (BELD4), which is generated using the BELD4 tool in the SA Raster Tools system, is consistently used in the FEST-C system as well as the WRF/CMAQ modeling system. Previous WRF/CMAQ system results provide daily weather inputs and nitrogen (N) deposition (optional), to the FEST-C system. In return, FEST-C generates initial soil texture and pH conditions, and daily ammonium and nitrate N pool status for specific crops assigned to agricultural land area the CMAQ bidirectional NH₃ modeling grids. The FEST-C system can be used in assessing not only the impacts of agricultural fertilization and management practices on air quality (NH₃) and climate (N₂O), but also the impacts of meteorology/climate and air quality (N deposition) on crop yield,

soil erosion, and overall nitrogen-carbon-phosphorus biogeochemical status of the agricultural ecosystem.

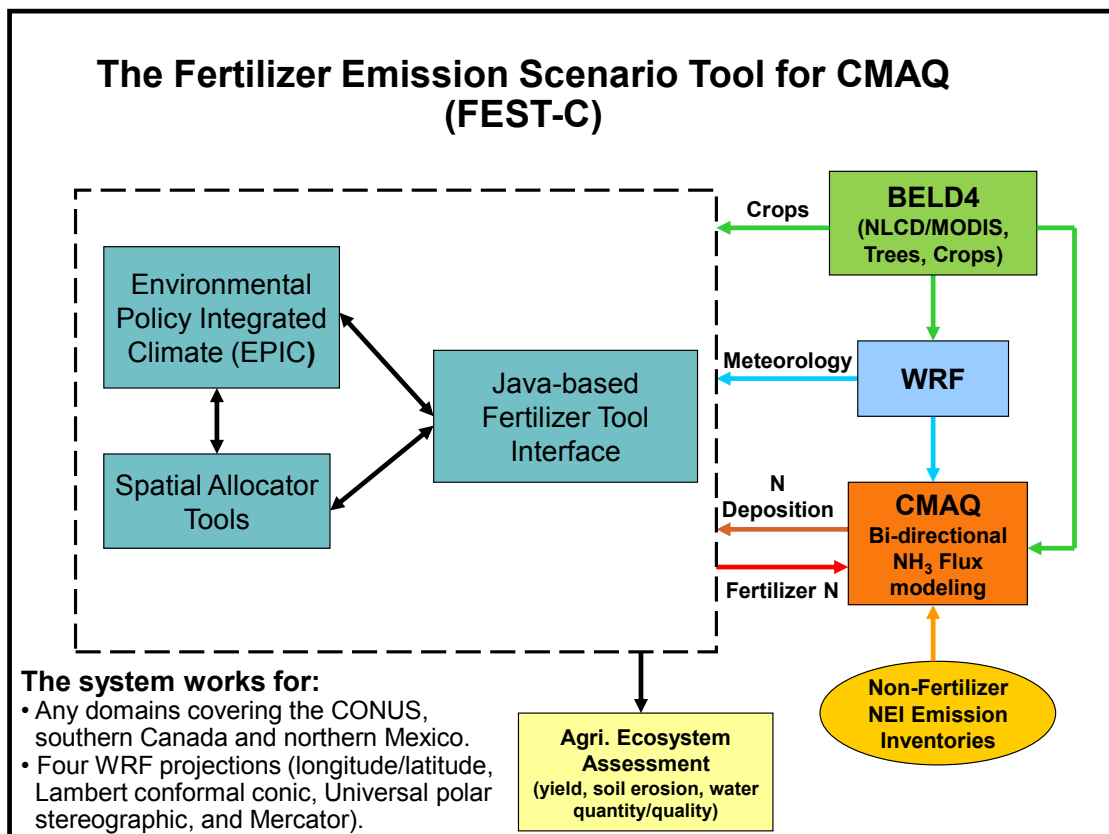

Figure 1. The FEST-C process diagram.

FEST-C is designed to be used for CMAQ domains in North America. As such, it is specifically configured for area representation and may not be appropriate for site-specific or small catchment applications. EPIC simulation results have been evaluated at the 12km and 4km grid cell resolutions over the U.S. Higher resolution, e.g., 1km simulations are possible, but choices of soil profiles and specialty crops of local but not necessarily national importance, e.g., berries, vineyards, etc. may not be well represented.

FEST-C 1.3 and 2.0 have complete modeling capabilities for grids located within the U.S. Land cover information for Canada and Mexico are being developed for 2011, but not yet ready for release. The interface has been prepared for these data (a 2011 option provided), but we recommend the use of 2006 land cover data until the 2011 data are released. Release notification

will be provided at <https://www.cmascenter.org/index.cfm>. For periods prior to 2011 and until the 2011 data release, the bidirectional CMAQ internally estimates required inputs for regions in Canada and Mexico. The system works for domains at different resolutions and in any of the four WRF projection coordinate systems: longitude/latitude, Lambert Conformal Conic, Universal Polar Stereographic, and Mercator.

This document serves as release notes for versions 1.2 and 2.0 of the FEST-C system. Though FEST-C is identical for v1.2 and v.2.0, the EPIC model underwent significant revisions to modularize the code. Future releases will branch from FEST-C v2.0.

1.2 Components

The version 1.3 and 2.0 releases of the FEST-C system, which include Java interface programs, EPIC FORTRAN codes, and SA Raster Tools C++ programs, was developed in Linux-based operating systems. The FEST-C Java interface is licensed under the Gnu Public License (GPL) version 3. The downloaded FEST-C system contains the following two directories:

- festc – contains the Java-based interface.
- epic – stores EPIC model version 0509 in FEST-C version 1.3 and EPIC model version 1102 (modularized version of EPICv0509) in FEST-C 2.0, which both have been modified by the EPA to meet CMAQ input requirements; and related utilities and data. The original EPIC model description can be obtained from Texas A&M University (TAMU), College Station, TX (<http://epicapex.tamu.edu/files/2013/02/epic0509usermanualupdated.pdf>). The documentation of the modified EPIC modeling system for CMAQ is included in the release of the FEST-C system. It provides detailed information on how this particular application of EPIC was developed.

The FEST-C system requires that the SA Raster Tools system be installed on the same system where FEST-C resides. For visualization, users can configure FEST-C to view netCDF files using the Visualization Environment for Rich Data Interpretation (VERDI) or NCVIEW. Both the SA Raster Tools and the VERDI system and their documentation can be obtained from the CMAS web site (<https://www.cmascenter.org/>).

1.3 Installation and Requirements

Users need to untar the obtained FEST-C and SA packages in their system from the CMAS Center Software Clearinghouse, <https://www.cmascenter.org>. Note that a Github page is available to track changes as releases become available; however, a cloned repository will not include the common model data needed within FEST-C. The programs under FEST-C do not need any compiling, as the system comes with static compiled tools. The Raster Tools under SA, which are required by FEST-C, are not statically pre-compiled with the package. Depending on the system configuration, users may need to recompile the SA Raster tools if there is a library call error when running the tools using FEST-C. Assuming that the downloaded FEST-C system is installed under the `#{FESTC_HOME}` directory and the Spatial Allocator is installed under the `#{SA_HOME}` directory, users should perform the following steps:

1. Modify `#{FESTC_HOME}/config.properties` to set:
 - `work.dir` – working directory for scenarios.
 - `epic.home` – epic home directory, which should be `#{FESTC_HOME}/epic`; **includes common data and executables for both EPIC and utilities.**
 - `sa.home` – installed Spatial Allocator directory, which should be `#{SA_HOME}`.
 - `visual.program.home` – directory containing VERDI program.
 - `queue.cmd` – queue job submission command such as `qsub` or `bsub`. Queue configuration (includes `queue.name` and `queue.bigmem` as well) for job submission has to be modified based on the user's Linux system. Comment out (place `#` sign in the front) the three queue configurations if user's systems do not have batch job queuing systems.
 - `queue.name` – queue name.
 - `queue.bigmem` – big memory setup to be used by the *EPIC-to-CMAQ* tool.
 - `debug` – set to "true" to print out debug message. It is recommended that users not change this setting.
 - `allow.diff.check` – set to "true" for checking consistent input in "Minimum Crop Acres" and "Fertilizer Year" fields from different subinterfaces. It is recommended that users not change this setting.

2. Make a directory called “**festc**” under the user’s home directory, which is assumed to be `${USER_HOME}`, then copy `${FESTC_HOME}/config.properties` to the `${USER_HOME}/festc` directory. Change the `work.dir` setting if needed.
3. Modify `${FESTC_HOME}/festc/festc` file to set:
 - `FESTC_HOME` to `${FESTC_HOME}/festc`.
 - `-Xmx1024M` to `-Xmx2048M` (optional) if users want to use 2 GB of RAM to run the interface.
 - JAVA path (optional) if users do not want to use the Standard Edition Runtime Environment (JRE) version 8 for Linux 32-bit and 64-bit systems that is included in the FEST-C release.
4. Modify `${FESTC_HOME}/festc_setup.csh` to:
 - Set the `${FESTC_HOME}` and `${SA_HOME}` directories.
 - Source the file in the user’s `.cshrc` file.
5. Launch FEST-C 1.3 or 2.0 interface by typing:
 - `festc` in any directory with the x-window capability.

Troubleshooting for the SA Raster Tools:

The SA Raster Tools have compiled tools which are stored under `${SA_HOME}/bin/64bits`. Those executable files may not work depending on the system configuration. If there is a library error in running the SA Raster Tools within FEST-C, users should:

- Recompile all libraries under `${SA_HOME}/src/libs` following instructions in the `${SA_HOME}/src/libs/README` file.
- Modify `${SA_HOME}/src/raster/Makefile` for correct paths.
- Type “make clean” to clean previous compiled programs.
- Type “make” to compile the tools.
- Type “make -B install” or “make install” to install compiled tools.

1.4 Interface Launch

The FEST-C interface facilitates the creation of the spatial associations, input files, soil initialization, and application processes required by EPIC. After preliminary site information and soils

are assigned to each grid cell, a 25-year “spin-up” simulation is required to generate initial soil and annual nitrogen demand conditions that represent the management system the user has defined. These initial conditions are provided to the year-specific application and management scheme. To launch the FEST-C interface system, type:

- festc or $\${FESTC_HOME}/festc/festc$

The FEST-C interface allows the user to create, select, and manage different scenario management schemes under the File menu for EPIC modeling and 13 sub-interface tools (see Figure 2).

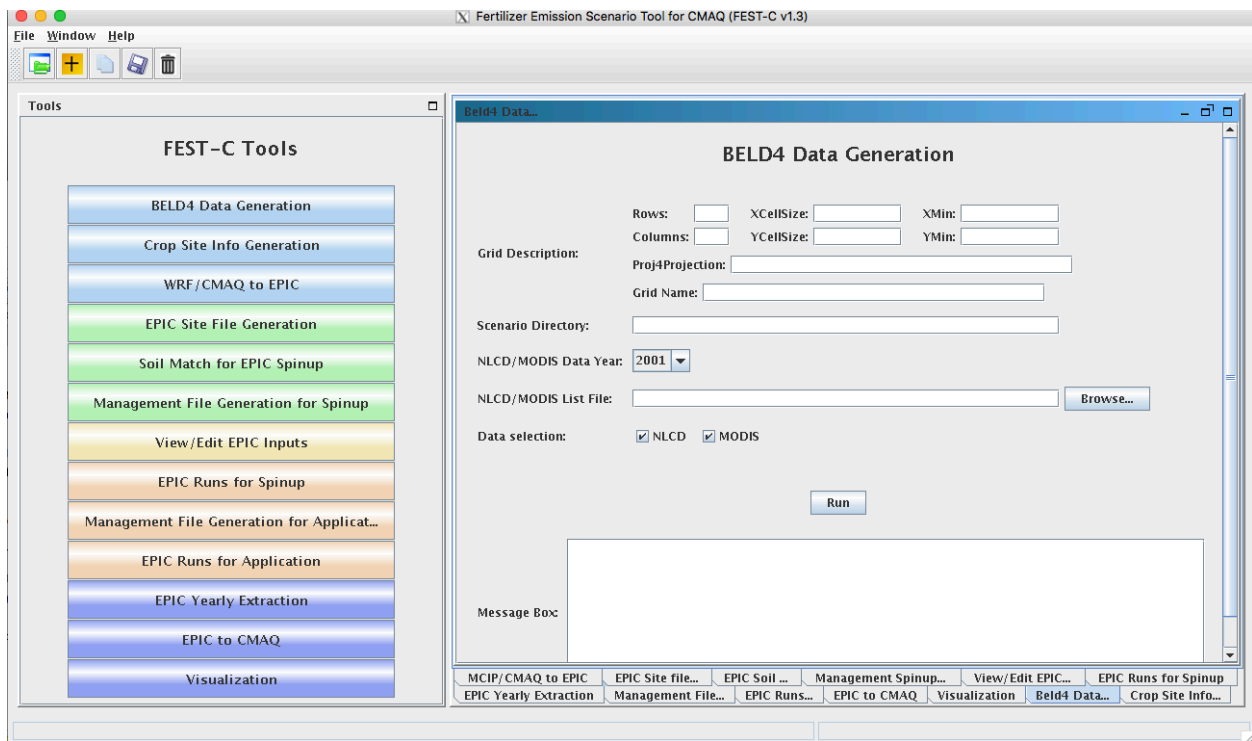

Figure 2. The FEST-C interface system.

The system is described in detail in the remaining sections of this document:

- Section 2: File Structures for EPIC Modeling
- Section 3: Scenario Management Selections under the File Menu

- Section 4: The Pre-EPIC File Generation Tools
 1. BELD4 Data Generation
 2. Crop Site Info Generation
 3. WRF/CMAQ to EPIC
- Section 5: EPIC Spin-up Run Tools:
 1. EPIC Site File Generation
 2. Soil Match for EPIC Spin-up
 3. Management File Generation for Spin-up
 4. View/Edit EPIC Inputs
 5. EPIC Runs for Spin-up
- Section 6: EPIC Application Run Tools
 1. Management File Generation for Application
 2. EPIC Runs for Application
- Section 7: Output Processing and Visualizing Tools:
 1. EPIC Yearly Extraction
 2. EPIC to CMAQ
 3. Visualization
- Section 8: Future Work

2. File Structures for EPIC Modeling

The EPIC model and related utilities and data are stored under the `#{FESTC_HOME}/epic` directory, scenarios are saved under `work.dir`, which can be different from `epic.dir`. The file structure for EPIC modeling within the FEST-C system is displayed in Figure 3.

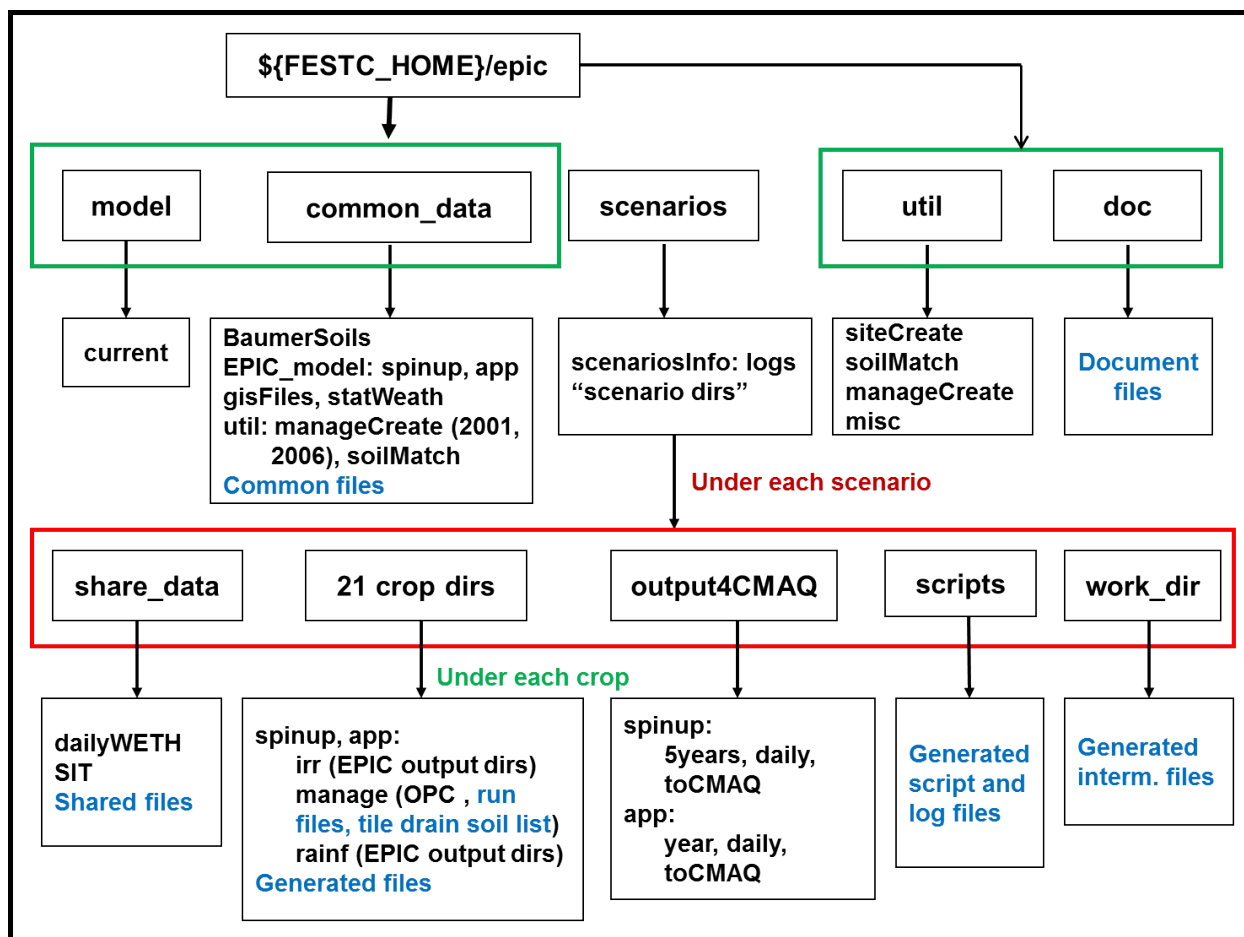

Figure 3. File structure for EPIC modeling (directory names in black and files in blue)

The **epic** directory contains four subdirectories: **model**, **util**, **common_data**, and **doc**; **scenarios** is under **work.dir**, which is specified in config file under home directory. These are described below.

- **model** – used to store the EPIC0509 model for FESTCv1.3 and EPIC1102 model (modular code of EPIC0509) for FESTCv2.0. It includes one subdirectory:
 - **current**: contains two current EPIC models for spin-up and application simulations for each model version (0509 and 1102). The models were developed for CMAQ modeling based on the EPIC0509 and 1102 versions of the EPIC model, obtained from the AgriLife Research, Blackland Research & Extension Center (<http://epicapex.tamu.edu/epic/>) at TAMU. The documentation on the development of the EPIC modeling system for CMAQ is included under the **\${FESTC_HOME}/epic/doc** directory.

- **util** – contains utility programs developed by Benson Consulting to generate site, soil, and management input files required by EPIC. It has three subdirectories:
 - **siteCreate:** contains two programs used by the *EPIC Site File Generation* tool. The programs will not only generate EPIC site files but also link EPIC sites (grid cell centroids) to the BELD4 crop grid assignments and the 8-digit hydrologic cataloging units (HUCs) that contain the grid cells to be used in the soil matching program. Based on BELD4, this program assigns only those crops to a grid cell that BELD4 indicates are present at that location. This minimizes the number of crop-specific simulations performed across large domains. The number of crops identified by BELD4 are dependent on both the grid cell resolution and the minimum cropland area area, usually 40ac or 0ac but can be any value, identified by the user. The larger the cropland area minimum, the fewer crops that will be identified within a grid, the fewer the grid-level simulations and the faster the overall system execution time.
 - **soilMatch:** contains six soil matching programs used by the *Soil Match for EPIC Spinup* tool. Soils are selected on the basis of the U.S. Department of Agriculture (USDA) 1997 Natural Resource Inventory (NRI) assignment of each crop in each 8-digit HUC to its most common HUC-8 soil type.
 - **manageCreate:** contains programs to create EPIC management files for spin-up and application simulations by the *Management File Generation for Spinup* and *Management File Generation for Application* tools.
 - **misc:** contains utility programs for converting the generated BELD4 land use file in netCDF format to be in IO/API format for the CMAQ bi-directional modeling (now automatic), aggregating EPIC variables from yearly average extraction output by regions (e.g. 8-digit hydrologic units, states, counties, and the whole domain) and by crops (e.g. 42 crops), summarizing N fertilizer application from extracted daily files for CMAQ, and generating files with selected EPIC daily output variables for the 8-digit HUC areas. Users can read the README file in the directory and modify the C shell scripts in the subdirectories to use the tools. The tools use R codes and users need R libraries installed for running the utilities.
- **common_data** – contains data sets needed for EPIC and utility programs. Also provided under this subdirectory is the file EPIC_42crop_names.txt, which contains the crop

names and numbers, used in the FEST-C system. This directory has the following subdirectories:

- **BaumerSoils**: contains the soil data sets (22,838 soils) built with soil parameters from the Baumer database developed by Dr. Otto Baumer of National Soil Survey Laboratory (NSSL) at USDA. Dr. Baumer used the SOILS5 database and soil pedon data to develop the representative EPIC data sets. Benson Consulting used this information to create a subset of soil parameters in 22,838 soil files to be used with EPIC. Detailed information on the data set creation can be obtained from the documentation of the EPIC modeling system for CMAQ. The raw soil profiles have been QA'd and missing descriptors have been filled so that they may be similar but are not identical to the profiles available through the USGS STATSGO and SURRGO databases.
- **EPIC_model**: Contains the following two directories containing common data files required by EPIC spin-up and application code in addition two 5-year average N deposition daily files that provide 5-year average CMAQ-simulated N deposition estimates for each calendar day for the periods 2002-2005 (referred to as “2002-2005 5-year CMAQ average” and 2006-2010 (referred to as “2006-2010 5-year CMAQ average”). These periods are provided to reflect the documented non-stationarity of N deposition trends.
- **spinup** – has common files used for EPIC spin-up simulations. For all crops except potatoes, the spin-up is set to run for 25 years using the EPIC statistical weather generator (see the weather generator discussion in the EPIC documentation from TAMU). We (Benson Consulting, EPA, and UNC) have arbitrarily set the starting year as 1978 in EPICCONT.DAT. The termination date is not used by any subsequent codes and, since the driving data are statistically generated, do not exactly correspond to any observation year. For potatoes, the spin-up is set to run for 100 years from 1903 in EPICCONT_POTATOES.DAT. The user can specify the deposition data/conditions to be used during spinup. Note that the deposition choice can/will impact the spinup results.
- **app** – contains common files used for EPIC application simulations. In the FEST-C system, users input the target year (1 year only) for the EPIC application

simulation. When a new scenario is created, EPICCONT.DAT from this directory is copied to the **scenarios/“scenario name”/share_data** directory and the simulation period is changed to 2 years starting from the year previous to the simulation year. Two years' worth of weather data are needed to support production of fall-sown crops. At present, the same weather is used for both years. In the future, an option may be added to support input of two unique weather time series.

- **gisFiles:** includes U.S. counties, U.S. states plus some boundary areas in Canada and Mexico, and U.S. 8-digit HUC shapefiles and elevation and slope image files. The readme file in the directory describes each file and associated attributes in detail.
- **statWeath:** contains weather station climate statistics files distributed with the standard EPIC package.
- **util:** includes common files used by the utility programs. This directory has two subdirectories:
 - **soilMatch** – has input files used by the soil matching program to create EPIC soil files for the *EPIC Runs for Spinup* tool.
 - **manageCreate** – contain files to be used in generating EPIC spin-up and application management files. We developed management data with fertilizer types applied in 2001 and 2006 for each of 10 production regions (Northeast, Appalachia, Southeast, Lake States, Corn Belt, Delta States, Northern Plains, Southern Plains, Mountain, and Pacific) (see the region map in Cooter et al. [2012], which is listed in the “Online Resources” section of the FEST-C web site (<http://www.cmascenter.org/fest-c/>)). Fertilizer types (but not amounts) applied are based on fertilizer sales of 62 major fertilizer types by state. Users can obtain detailed information from the documentation for the EPIC modeling system for CMAQ. It is recommended that 2001 be used for applications prior to 2006, and that 2006 be used for applications from 2006 through 2010. We anticipate that a 2011 fertilizer type file will be included in the next interim release. Fertilizer types applied are used by the EPIC management file generation for application, and they are stored under the following two subdirectories:
 - **2001:** for 2001 fertilizer year management file generation.

- **2006:** for 2006 fertilizer year management file generation.

In both cases, regional fertilizer data information is stored under the directory:

- **regionFert**
- **scenarios** – contains EPIC application scenarios and is described separately below this bulleted list.
- **doc** – contains documents on the EPIC modeling system for CMAQ (EPA_EPIC_application_v1_10252013.pdf).

In general, users should not change the data files described in the above directories. All files generated by users' applications are stored under the **scenarios** directory. When the user creates a scenario by selecting “*New Scenario*” under the File menu, the following items are created:

- **scenariosInfo** – a metadata file that stores information for the created scenario, which is assumed to be named by the user as “**scenario name**”. This directory contains:
 - “**scenario name**”: an XML file that stores the scenario information.
 - **logs**: directory containing the script file used to create (or copy or delete as well) the scenario and execution log file.
- “**scenario name**” – scenario directory that will contain all generated files for this scenario.

Under each scenario directory, the following directories are created for EPIC modeling:

- **share_data** – contains all data sets generated for EPIC modeling and to be used by all crops modeled. After users generate EPIC site files and daily weather, it will contain the following two subdirectories:
 - **SIT**: contains EPIC site files.
 - **dailyWETH**: contains daily weather and N files for EPIC modeling.
- **scripts** – stores script and log files created to run the tools within the FEST-C interface. All tools are executed through the Linux queue system. Users should always check the log file to make sure that the queue job completed correctly. Unwanted files under this directory should be cleaned out periodically.
- **work_dir** – contains some intermediate or temporary files created by the FEST-C tools. Currently, not many files are created under this directory.

- **21 crop dirs** ("HAY", "ALFALFA", "OTHER_GRASS", "BARLEY", "EBEANS", "CORNG", "CORNS", "COTTON", "OATS", "PEANUTS", "POTATOES", "RICE", "RYE", "SORGHUMG", "SORGHUMS", "SOYBEANS", "SWHEAT", "WWHEAT", "OTHER_CROP", "CANOLA", "BEANS") – the 21 crop directories are created by the *EPIC Site File Generation* tool. Under each crop directory there are many files that are created for generating EPIC input files. The **spinup** and **app** subdirectories described below are also created from management file generation and EPIC runs for spin-up and application:
 - **spinup**: contains files created from the EPIC management file generation and EPIC runs for spin-up tools. It contains the following three subdirectories:
 - **manage** – contains EPIC run files, EPIC site management files created by the *Management File Generation for Spinup* tool, and tile drain soil list file. The management files and tile drain soil list file are contained under the following subdirectories:
 - **OPC**: contains the management schedule for each domain grid cell containing rain-fed and irrigated crop. Variables (schedule) can be interpreted using the documentation for the EPIC modeling system for CMAQ.
 - **tileDrain**: contains the SOILLIST.DAT which has soil tile drain information for EPIC spinup runs. In general, if a soil is classified as hydric, then it is assumed to drain.
 - **rainf** – contains files for each domain grid cell containing the particular crop that were created by the *EPIC Runs for Spinup* tool from rain-fed crops. It contains the following output directories (see the EPIC documentation from TAMU):
 - **DFA**: daily fertilizer and other output.
 - **NCM**: monthly fertilizer and other output.
 - **NCS**: monthly soil output.
 - **OUT**: standard EPIC output file that contains various budget tables and summaries of the simulation which are useful for debugging.
 - **SOL**: soil output files that are used as initial values for the application.
 - **TNA**: annual fertilizer and other outputs.
 - **TNS**: annual soil output.

- **irr** – contains files for each domain grid cell containing the particular crop that were created by the *EPIC Runs for Spinup* tool from irrigated crops. It contains the following output directories:
 - **DFA**: daily fertilizer and other output.
 - **NCM**: monthly fertilizer and other output.
 - **NCS**: monthly soil output.
 - **OUT**: standard EPIC output file that contains various budget tables and summaries of the simulation that are useful for debugging.
 - **SOL**: soil output files.
 - **TNA**: annual fertilizer and other outputs that are useful for debugging.
 - **TNS**: annual soil output.
- **app**: contains files created from the management file generation and EPIC runs for application tools. It contains the following three subdirectories:
 - **manage** – contains EPIC run files, EPIC site management files created by the *Management File Generation for Application* tool, and tile drain soil list file. Management files and the tile drain soil list file are contained under the following subdirectories:
 - **OPC**: contains the management schedule for each domain grid cell containing rain-fed and irrigated crop. Variables (schedule) can be interpreted using the documentation for the EPIC modeling system for CMAQ.
 - **tileDrain**: contains the SOILLIST.DAT which has soil tile drain information for EPIC application runs.
 - **rainf** – contains files created by the *EPIC Runs for Application* tool from rain-fed crops. It contains the following output directories (see the EPIC documentation from TAMU):
 - **DFA**: daily fertilizer and other output.
 - **NCM**: monthly fertilizer and other output.
 - **NCS**: monthly soil output.
 - **OUT**: standard EPIC output file that contains various budget tables and summaries of the simulation (useful for debugging).

- **SOL:** soil output files.
- **TNA:** annual fertilizer and other outputs.
- **TNS:** annual soil output.
- **irr** – contains files created by the *EPIC Runs for Application* tool from rain-fed crops. It contains the following output directories:
 - **DFA:** daily fertilizer and other output.
 - **NCM:** monthly fertilizer and other output.
 - **NCS:** monthly soil output.
 - **OUT:** standard EPIC output file that contains various budget tables and summaries of the simulation (useful for debugging).
 - **SOL:** soil output files.
 - **TNA:** annual fertilizer and other output.
 - **TNS:** annual soil output.
- **output4CMAQ** – stores EPIC output files and extracted netCDF files for quality assurance (QA) and CMAQ bidirectional NH₃ modeling. This directory contains the two following subdirectories:
 - **spinup:** contains all files created from EPIC spin-up simulations for CMAQ. It contains the following three subdirectories:
 - **5years** – contains extracted average EPIC output for each crop from the last five years of the spin-up simulation. Files are named as “BELD4 Crop Number”.dat (see Table 1 in Section 4.1 for crop numbers).
 - **daily** – stores daily EPIC output files for the EPIC spin-up simulation of each crop. “BELD4 Crop Number”.NCS is for soil output and “BELD4 Crop Number”.NCD is for fertilizer and other daily output.
 - **toCMAQ** – contains created netCDF and IO/API files with EPIC spin-up output for selected modeling grid cells with crop data. The netCDF output files are created using the FEST-C tools by extracting data files stored under the **5years** or **daily** directories listed above.
 - **app:** stores files created from EPIC application simulations for CMAQ. It contains the following three subdirectories:

- **year** – contains extracted average EPIC output for the EPIC application year. Files are named as “BELD4 Crop Number”.dat.
- **daily** – stores daily EPIC output files for the EPIC application simulation of each crop. “BELD4 Crop Number”.NCS is for soil output and “BELD4 Crop Number”.NCD is for fertilizer and other daily output.
- **toCMAQ** – contains created netCDF and IO/API files with EPIC application simulation results for selected modeling grid cells with crop data. Included is the beld4 IOAPI file needed for bidirectional estimate of ammonia flux from agricultural cropland within CMAQ. The netCDF output files are created using the FEST-C tools by extracting data files stored under the **year** or **daily** directories listed above.

3. Scenario Management Selections under the File Menu

There are five scenario management selections (as well as Exit) under the File menu at the upper left of the FEST-C tool bar: Open Scenario, New Scenario, Copy Scenario, Save Scenario, and Delete Scenario. Each of these is described below.

- **Open Scenario** – to open an already-created scenario. Users always need to either open or create (see next bullet) a scenario to work on. Users can select any one of the scenarios under the **scenarios/scenariosInfo** directory. After users open a scenario, information for the scenario, such as the domain description, will be automatically filled in by the FEST-C tool interface. Within the FEST-C system, users have to work within a scenario to execute any of the tools except the *Visualization* tool. Figure 4 shows the interface used to open the test case created in the FEST-C system (The test_case scenario is described at the beginning of Section 4).
- **New Scenario** – to create a new scenario (versus opening one that's already been created). In creating a new scenario, the user has to provide the following information for a CMAQ modeling domain and EPIC simulation year (see Figure 5):
 - Rows, Columns: the number of rows and columns for the domain.
 - XCellSize, YCellSize: *x* and *y* resolution for the grid cell.

- XMin, YMin: x and y coordinates of the lower left corner of the lower left grid cell. Users can often find this information in the GRIDDESC file in the Meteorology-Chemistry Interface Processor (MCIP) output.

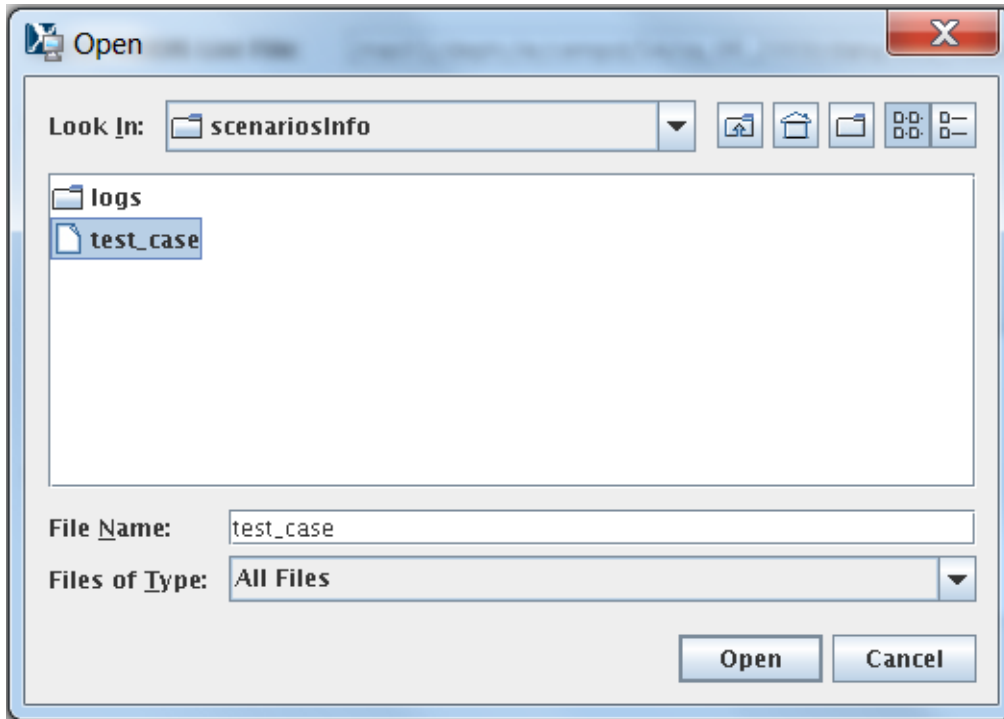

Figure 4. Open Scenario selection window used to open the test_case scenario.

The screenshot shows a window titled "Create a New Scenario" with the following fields and values:

- Grid Description:**
 - Rows: 25
 - XCellSize: 12,000
 - XMin: -84,000
 - Columns: 25
 - YCellSize: 12,000
 - YMin: 204,000
 - Proj4Projection: 6370000.0 +lat_1=33 +lat_2=45 +lat_0=40 +lon_0=-97
 - Grid Name: TESTGRID
- Simulation Year:** 2006
- NLCD/MODIS Data Year:** 2006 (dropdown menu)
- Scenario Name:** test_case

Buttons: Create, Cancel

Figure 5. New Scenario selection window with input to create the test_case scenario within FEST-C.

- Proj4Projection: domain projection defined in Proj4 format (see details at http://www.remotesensing.org/geotiff/proj_list/). The interface sets the Lambert Conformal Conic projection, which is used by the CMAQ U.S. 12-km domain as the default. Users can change it to any projection supported for CMAQ modeling.
 - Grid Name: user-supplied name for the domain, using no more than 16 alphanumeric characters and no spaces.
 - Simulation Year: year (YYYY) for the EPIC simulation. FEST-C is designed to simulate yearly fertilizer application information for CMAQ bidirectional NH₃ modeling.
 - NLCD/MODIS Data Year: year (YYYY) for the NLCD/MODIS land cover data used for the EPIC simulation. NLCD/MODIS land cover data are required in the EPIC simulation within FEST-C for CMAQ bidirectional NH₃ modeling. Currently, users can select 2001, 2006, or 2011 NLCD/MODIS data year.
 - Scenario Name: name for the scenario, using alphanumeric characters and no spaces.
- When a new scenario is created, the following files and directories are created:
- **scenarios/scenariosInfo/“scenario name”**: XML file to store the scenario information.

- **scenarios/“scenario name”**: directory to store all generated information for this scenario. Some subdirectories are also generated under this scenario directory (see Section 2 for file structures).
- **scenarios/“scenario name”/share_data/EPICCONT.DAT**: contains EPIC constant parameters. The simulation period is a two-year period starting with the year before the simulation year.
- Copy Scenario – to copy an existing scenario under the **scenarios/scenariosInfo** directory to a new scenario with a defined simulation year, which can be the same as or different from the existing scenario year (see Figure 6). Note that if the existing scenario contains many crop simulations, this action can take a long time to complete in a background queue job.
- Save Scenario – to save a scenario after a user has worked on it. Only the input information for the scenario tool interfaces is saved. When the user performs the FEST-C tool actions, generated files are always saved under different directories, described in Section 2.

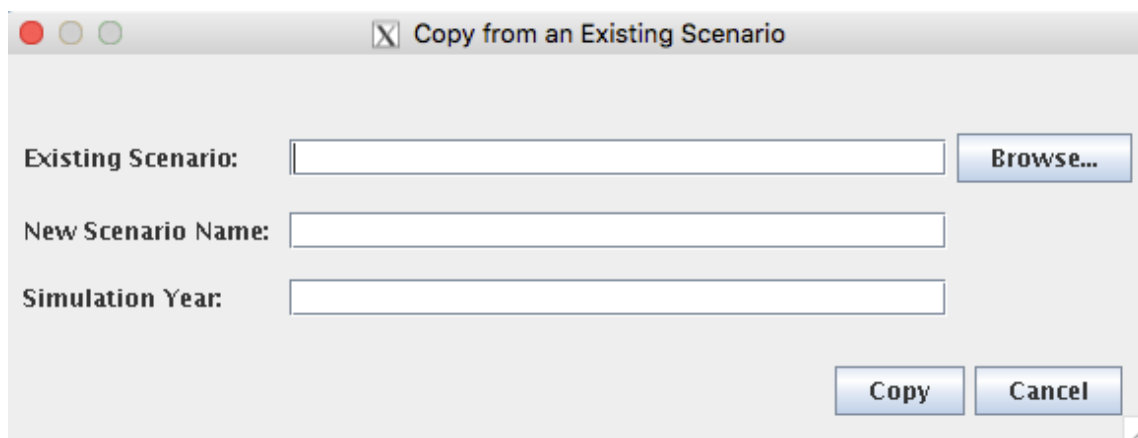

Figure 6. Copy Scenario selection window.

- Delete Scenario – to delete a scenario. This is also run as a background submission and can take some time. All directories and subdirectories for that scenario are deleted completely.
- Exit – to exit the FEST-C interface. You will be asked if you want to save the scenario you were working on before exiting the tool.

The action performed by making a selection under the File menu (e.g., copy, create, delete) is executed by a script file through the queue job. The script and log files are stored under the **scenarios/scenariosInfo/logs** directory. Users should check the log files under the directory to make sure that the selected action completely correctly.

4. The Pre-EPIC File Generation Tools

Before describing the various FEST-C tools in Sections 4 through 7, we must first discuss the `test_case` scenario in the FEST-C system, because we use this scenario to demonstrate the input and output components on the tool interface. The `test_case` scenario is a small 12-km domain with 25 rows and 25 columns in the CMAQ standard projection. The domain is located in the northwest corner of Iowa and crosses into Minnesota, South Dakota, and Nebraska. Figure 7 illustrates the domain grid cells with the identification numbers (GRIDID) used in the FEST-C system; colors are used to indicate the crop percentage for each grid cell as generated from 2006 NLCD data. All 625 (25×25) 12-km grid cells in this test domain have crop coverage, and most of them have more than 75% crop coverage. The GRIDID for a grid cell with row and column starting from 1 is defined as:

$$GRIDID = columns(row - 1) + column \quad (1)$$

where *columns* is the number of columns for the domain. Row and column start from 1 at the lower left corner cell in the domain. Users can compute the row and column for a grid cell with GRIDID as:

$$row = floor[(GRIDID - 1) / column] + 1 \quad (2)$$

$$col = remainder[(GRIDID - 1) / columns] + 1 \quad (3)$$

where *floor* is for rounding down the value and *remainder* is for taking the remainder from the division.

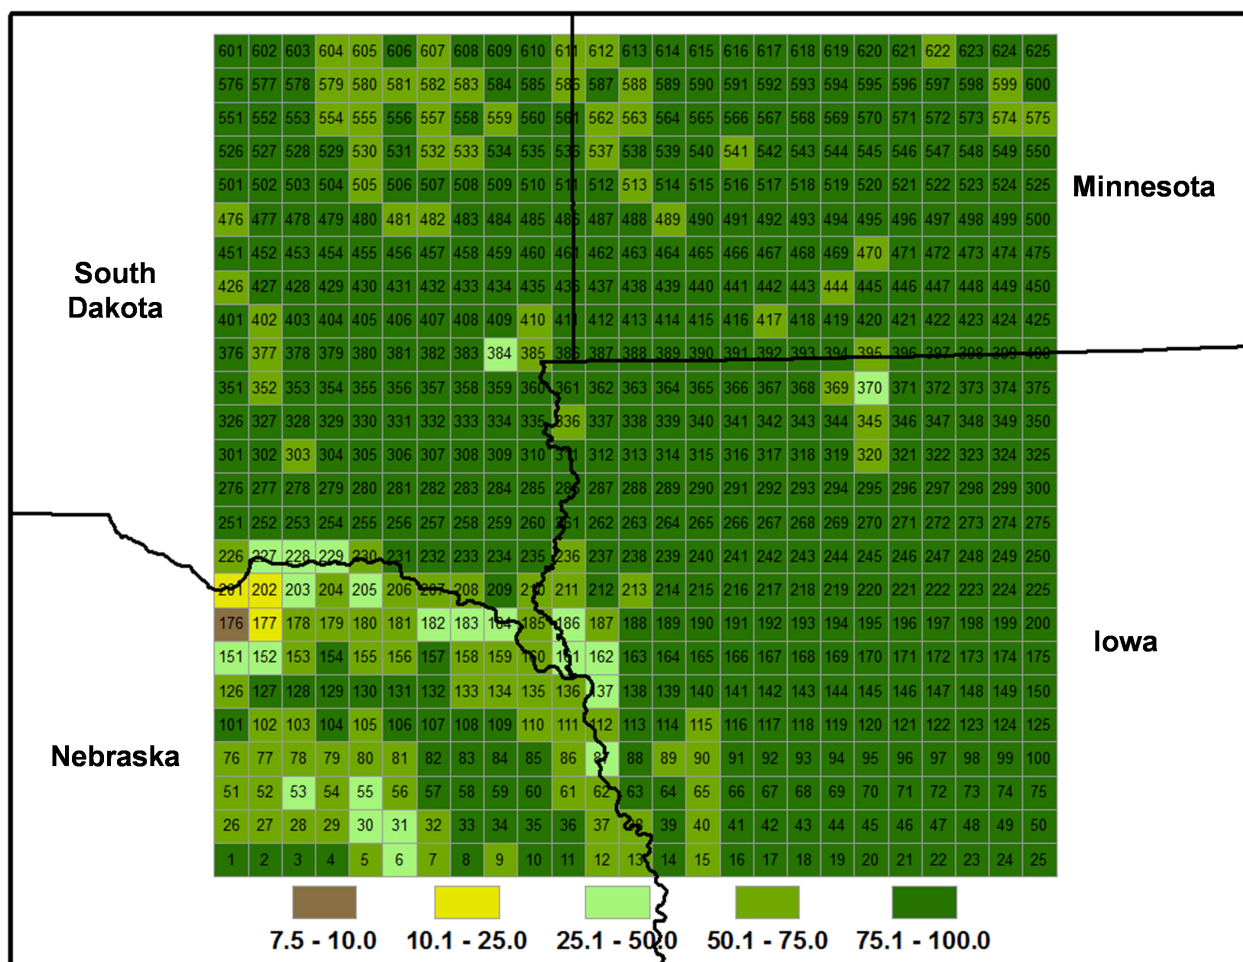

Figure 7. FEST-C test_case scenario 12-km domain in the U.S. northern Central Plains. Associated with each grid cell is an identification number (GRIDID) and a color that indicates crop coverage percentage. The domain's cells are numbered from 1 for the lower left corner cell to 625 for the upper right corner cell.

In Section 4, we discuss the first three tools in the FEST-C interface: the *BELD4 Data Generation* tool, the *Crop Site Info Generation* tool, and the *WRF/CMAQ-to-EPIC* tool. These are used to prepare site crop and spatial data for EPIC input file generation and to generate required daily weather data and optional nitrogen deposition data for the EPIC simulation year. All three tools were developed in the SA Raster Tools system.

4.1 BELD4 Data Generation

EPIC modeling for a CMAQ domain requires BELD4 data, which are used for selecting grid cells with crop coverage. The *BELD4 Data Generation* tool allows users to compute the BELD4 dataset for a selected scenario. For detailed information, users can consult the SA Raster Tools documentation: http://www.cmascenter.org/sa-tools/documentation/4.0/html/Raster_Users_Guide_4_0.htm.

Figure 8 shows the interface used to compute the BELD4 dataset for the test_case scenario.

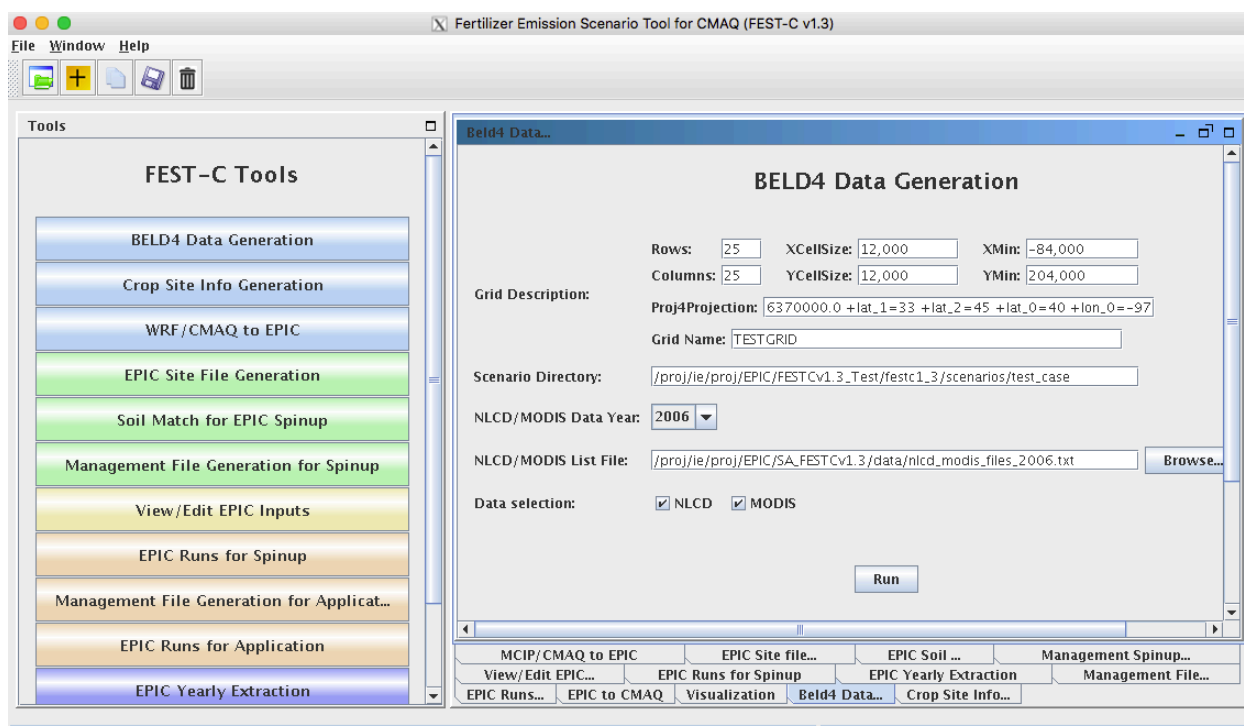

Figure 8. The *BELD4 Data Generation* tool interface for the test_case scenario.

Before running this tool, users need only to make sure that the following two entries are correct for their scenarios:

- NLCD/MODIS Data Year – the year defined when creating the scenario; it can be either 2001, 2006, or 2011. Processed 2001, 2006, and 2011 crop tables from the U.S. and Canada are stored under the $\{\text{SA_HOME}\}/\text{data}$ directory for this tool. The 42 rain-fed and irrigated crops generated from the BELD4 tool and modeled in the FEST-C system are displayed in Table 1. Table 2 provides additional information on how crops are

mapped for each crop type. In addition to crop numbers used in BELD4 (new version of BELD), the table also lists BELD3 (older version) numbers, because we started building the FEST-C system using the BELD3 data. Crop numbers used in EPIC modeling often follow the BELD3 crop numbers (from 22 to 63), but the output files from EPIC modeling for use in CMAQ use the BELD4 crop numbers (from 1 to 42). If a new crop is to be modeled in the FEST-C system, new crop tables under the SA **data** directory have to be generated and the BELD4 tool has to be modified as well.

Table 1. The 42 rain-fed and irrigated crops modeled in the FEST-C system.

BELD4	BELD3	Crop Name	BELD4	BELD3	Crop Name	BELD4	BELD3	Crop Name
1	22	Hay	15	36	Cotton	29	50	SorghumSilage
2	23	Hay_ir	16	37	Cotton_ir	30	51	SorghumSilage_ir
3	24	Alfalfa	17	38	Oats	31	52	Soybeans
4	25	Alfalfa_ir	18	39	Oats_ir	32	53	Soybeans_ir
5	26	Other_Grass	19	40	Peanuts	33	54	Wheat_Spring
6	27	Other_Grass_ir	20	41	Peanuts_ir	34	55	Wheat_Spring_ir
7	28	Barley	21	42	Potatoes	35	56	Wheat_Winter
8	29	Barley_ir	22	43	Potatoes_ir	36	57	Wheat_Winter_ir
9	30	BeansEdible	23	44	Rice	37	58	Other_Crop
10	31	BeansEdible_ir	24	45	Rice_ir	38	59	Other_Crop_ir
11	32	CornGrain	25	46	Rye	39	60	Canola
12	33	CornGrain_ir	26	47	Rye_ir	40	61	Canola_ir
13	34	CornSilage	27	48	SorghumGrain	41	62	Beans
14	35	CornSilage_ir	28	49	SorghumGrain_ir	42	63	Beans_ir

Table 2. Mapping of the 42 rain-fed and irrigated crops for US, Canada. Mexico will be available in a future release.

BELD4	Crop Name	USA	Canada
1	Hay	HAY- (HAY, ALFALFA)-(HAY, WILD) + HAYLAGE, (EXCL ALFALFA)	All other tame hay and fodder crops
2	Hay_ir	Same items, irrigated	N/A
3	Alfalfa	ALFALFA HAY + ALFALFA HAYLAGE	Alfalfa and alfalfa mixtures
4	Alfalfa_ir	Same items, irrigated	N/A
5	Other_Grass	(AG LAND, CROPLAND, PASTURED ONLY)- (Hay+Alfalfa)	N/A
6	Other_Grass_ir	N/A	N/A
7	Barley	BARLEY	Barley
8	Barley_ir	BARLEY, irrigated	N/A
9	BeansEdible	BEANS, DRY EDIBLE, LIMA; BEANS, DRY EDIBLE, (EXCL LIMA)	Dry white beans; Other dry beans
10	BeansEdible_ir	BEANS, DRY EDIBLE, LIMA, IRRIGATED; BEANS, DRY EDIBLE, (EXCL LIMA), IRRIGATED	N/A
11	CornGrain	CORN, GRAIN	Corn for grain
12	CornGrain_ir	CORN, GRAIN, IRRIGATED	N/A
13	CornSilage	CORN, SILAGE	Corn for silage
14	CornSilage_ir	CORN, SILAGE, IRRIGATED	N/A
15	Cotton	COTTON	N/A
16	Cotton_ir	COTTON, IRRIGATED	N/A
17	Oats	OATS	Oats
18	Oats_ir	OATS, IRRIGATED	N/A
19	Peanuts	PEANUTS	N/A
20	Peanuts_ir	PEANUTS, IRRIGATED	N/A
21	Potatoes	POTATOES+SWEET POTATOES	Potatoes
22	Potatoes_ir	Same fractional breakdown of rainfed vs irrigated potatoes from 2006 data	N/A
23	Rice	N/A	N/A
24	Rice_ir	RICE, IRRIGATED	N/A
25	Rye	RYE	Fall rye
26	Rye_ir	RYE, IRRIGATED	N/A
27	SorghumGrain	SORGHUM, GRAIN	N/A
28	SorghumGrain_ir	SORGHUM, GRAIN,	N/A

		IRRIGATED	
29	SorghumSilage	SORGHUM, SILAGE	N/A
30	SorghumSilage_ir	SORGHUM, SILAGE, IRRIGATED	N/A
31	Soybeans	SOYBEANS	Soybeans
32	Soybeans_ir	SOYBEANS, IRRIGATED	N/A
33	Wheat_Spring	WHEAT, SPRING, DURUM; WHEAT, SPRING, (EXCL DURUM)	Spring wheat (excluding durum); Durum wheat
34	Wheat_Spring_ir	WHEAT, SPRING, DURUM, IRRIGATED; WHEAT, SPRING, (EXCL DURUM), IRRIGATED	N/A
35	Wheat_Winter	WHEAT, WINTER	Winter wheat
36	Wheat_Winter_ir	WHEAT, WINTER, IRRIGATED	N/A
37	Other_Crop	(AG LAND, CROPLAND)- (AG LAND, CROPLAND, PASTURED ONLY) - sum of rainfed crops If "AG LAND, CROPLAND" is larger	Mixed grains; Spring rye; Flaxseed; Forage seed for seed; Mustard seed; Sunflowers; Canary seed; Ginseng; Buckwheat; Sugar beets; Caraway seed; Triticale; Other field crops
38	Other_Crop_ir	Irrland= (AG LAND, (EXCL HARVESTED CROPLAND), IRRIGATED – ACRES) +(AG LAND, CROPLAND, HARVESTED, IRRIGATED – ACRES) =Irrland – sum of irr crops (if irrland is larger)	N/A
39	Canola	CANOLA	Canola (rapeseed)
40	Canola_ir	CANOLA, IRRIGATED	N/A
41	DFBeans	PEAS, DRY EDIBLE	Dry field peas; Lentils; Chick peas
42	DFBeans_ir	PEAS, DRY EDIBLE, IRRIGATED	N/A

- NLCD/MODIS List File – set to the fixed-format text file that contains downloaded NLCD land use, imperviousness, and canopy data files and downloaded tiled MODIS land cover (MCD12Q1) data sets. The interface sets the file $\text{\$SA_HOME}/\text{data}/\text{nlcd_modis_files_}\{\text{NLCD/MODIS Data Year}\}.\text{txt}$ as the default file. Users need to download NLCD and MODIS land cover data sets and modify the text file accordingly using the paths and names for the downloaded data sets. The text file has to have the

same fixed titles and format as in the default file. `${SA_HOME}/data/sat/README` contains instructions on downloading the data sets. If users want to generate a 2001 BELD4 data set, 2001 NLCD and MODIS land cover data sets have to be downloaded from the NLCD web site (<https://www.mrlc.gov/finddata.php>) and MODIS land products web site (https://lpdaac.usgs.gov/dataset_discovery/modis/modis_products_table/mcd12q1), and the `nlcd_modis_files_2001.txt` list file has to be modified following the format in this sample file.

When the Run button on the *BELD4 Data Generation* tool interface is clicked, a csh script file is generated under the `scenarios/"scenario name"/scripts` directory. This file is submitted to the system as a queue job after the user clicks OK, and a log file for the job execution will be generated after the queue job is finished. Users should always check for error messages in the log file, based on the information provided in the Message Box (shown in Figure 8).

The outputs produced by the tool are the following two files, which are stored under the `scenarios/"scenario name"/share_data` directory:

- `beld4_{Grid Name}_{NLCD/MODIS Data Year}.nc` (`beld4_TESTGRIDS_2006.nc` for the `test_case` scenario) – both netCDF and I/O API formatted files containing gridded percentage data for imperviousness, canopy, 194 tree species, 40 NLCD/MODIS land cover classes, and 42 BELD4 crops are created. The netCDF domain- and resolution-specific data file is a required input to the *Crop Site Info Generation* tool discussed in the next section. CMAQ bi-directional NH₃ modeling, required the I/O API formatted BELD4 output file
- `beld4_{Grid Name}_{NLCD/MODIS Data Year}.txt` (`beld4_TESTGRIDS_2006.txt` for the `test_case` scenario) – a text table containing gridded percentage data for imperviousness, canopy, and 40 NLCD/MODIS land cover classes for a specific domain and grid resolution.

4.2 Crop Site Info Generation

The *Crop Site Info Generation* tool is used to compute EPIC site (grid cells) and crop information for EPIC modeling. The tool processes spatial boundary shapefiles and elevation and slope image data to generate site information data needed in EPIC modeling. Figure 9 displays the tool interface used to compute the crop site information for the test_case scenario. The tool uses the spatial data sets stored under $\${FESTC_HOME}/\text{epic}/\text{common_data}/\text{gisFiles}$ and input files from the $\${SA_HOME}/\text{data}$ directory. Before running this tool, users need only to choose the following two entries for this tool:

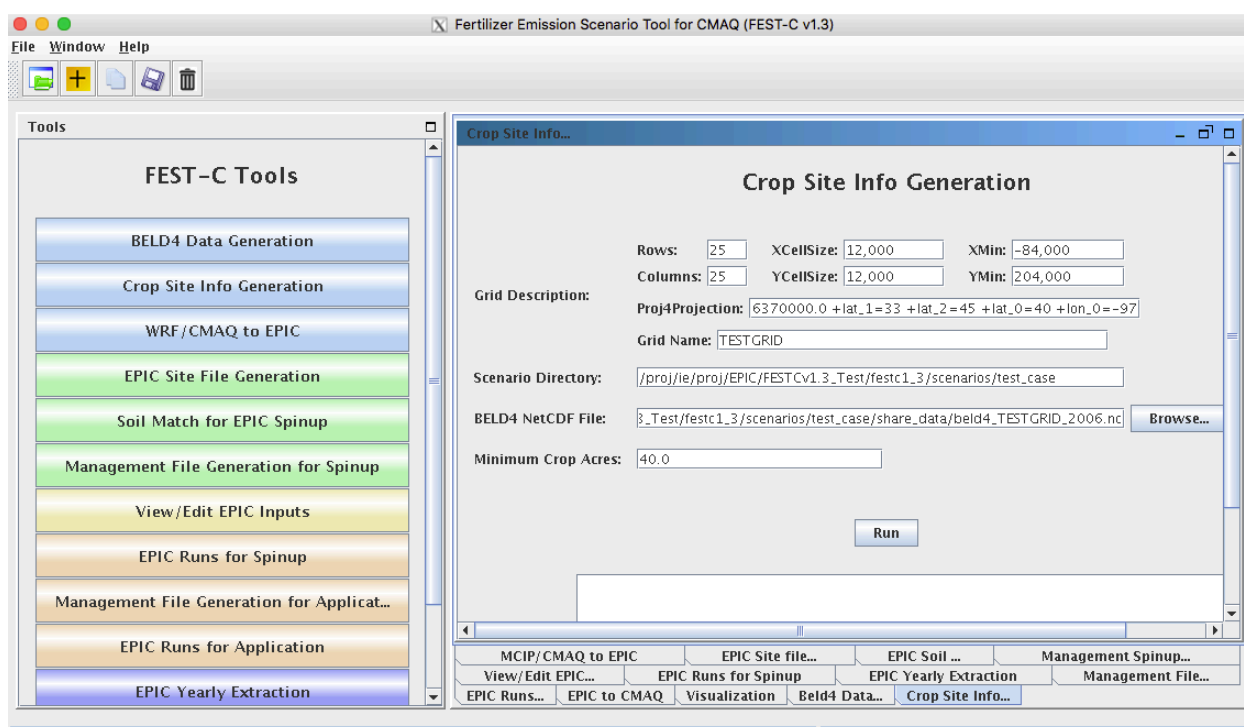

Figure 9. The *Crop Site Info Generation* tool interface used for the test_case scenario.

- BELD4 netCDF File – this is often the BELD4 netCDF file generated using the previous tool. The file name should be of the form beld4_{Grid Name}_{NLCD/MODIS Data Year}.nc (beld4_TESTGRIDS_2006.nc for the test_case scenario). If this file does not exist, the interface will indicate this after Run is clicked. If this is the case, users need to either run the previous tool to generate this data set or input anywhere within the computer system a BELD4 netCDF file that is based on the same domain as the domain of the scenarios with which the users are working.

- Minimum Crop Acres – this is the minimum crop area for at least one of the 42 possible crops in a grid cell if the grid cell is to be selected for EPIC simulation. The default is set to 40 acres, which is what we have used for CMAQ 12-km grid modeling; this is intended to represent the smallest commercially viable farm size. For finer grid resolutions or for domains in which smaller commercial enterprises make up a significant fraction of farms (e.g., orchards, some vegetable and specialty crops), users may need to reduce this minimum to adequately characterize the distribution of agricultural lands. Doing so may increase the number of simulated grid cells (sites), which can also increase run time.

After Run has been clicked and the queue job has completed, users should check the log file under their scenario's **scripts** directory to see whether any errors occurred during execution.

The tool generates the following two text output files stored under **scenarios/"scenario name"/share_data**:

- EPICSites_Info.csv – contains the GRIDID, XLONG, YLAT, ELEVATION, SLOPE_P, HUC8, REG10, STFIPS, CNTYFIPS, GRASS, CROPS, CROP_P, COUNTRY, and COUNTRY-PROVINCE items used for creating EPIC site files.
- EPICSites_Crop.csv – contains the GRIDID, acreages of 42 possible crops within each grid cell, COUNTRY, and HUC8 items used in EPIC site and soil file generation.

4.3 WRF/CMAQ to EPIC

The *WRF/CMAQ-to-EPIC* tool is used to generate EPIC daily weather data and, if the option is selected, N deposition inputs to be used in EPIC application simulations. The tool reads EPIC grid cell information stored in the EPICSites_Info.csv file generated using the previous tool. It extracts EPIC daily weather input data from WRF simulation output (METCOR2D data arrays). There are up to four options currently available for the inclusion of daily atmospheric deposition data: (1) no N deposition, (2) the original EPIC default (assumes a constant N concentration of 0.8 ppm in precipitation and no dry deposition), and (3) CMAQ hourly output files (DRYDEP, WETDEP1) from a previous CMAQ run (unidirectional or bidirectional), and (4) a pre-processed set of 5-yr average CMAQ deposition estimates for the period 2002-2005 (labeled as 2004) and 2006-2010 (labeled as 2008). When daily deposition inputs are to be used, they are

created or extracted and are appended to the end of each daily weather record. If the average option is used, select option (1), no N deposition. The average input option is then requested at the EPIC simulation step. In the vicinity of areas receiving significant atmospheric dry deposition, such as areas immediately surrounding large animal feeding operations, this information can impact EPIC biogeochemistry and subsequent estimates of plant N application needs. If speciated N deposition is available, oxidized wet and dry deposition are assumed to enter the EPIC soil nitrate pool, and reduced wet and dry deposition is assumed to enter the EPIC soil ammonium pool. If CMAQ hourly output files are used, the MCIP and CMAQ domains must be the same as the domain defined in the EPIC scenario. Figure 10 shows this tool interface as used for the test_case scenario.

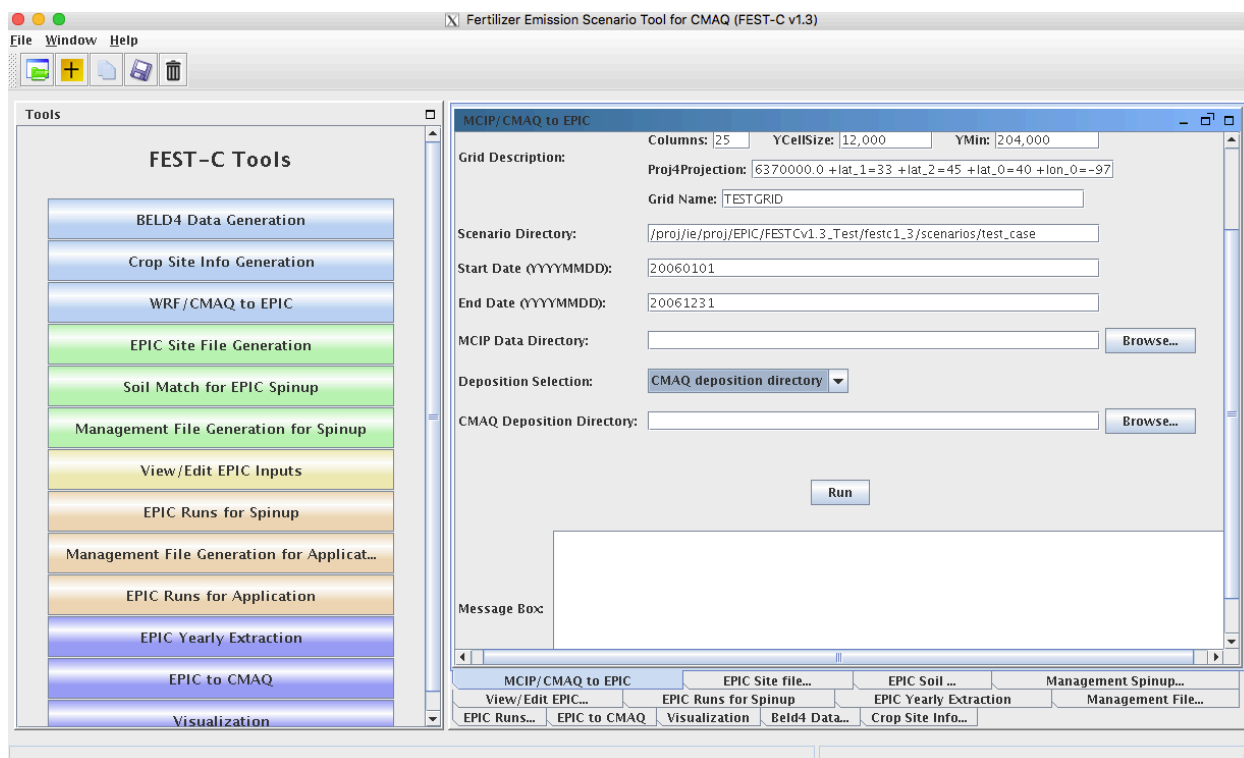

Figure 10. The *WRF/CMAQ-to-EPIC* tool interface used for the test_case scenario.

Before running this tool, users have to provide input for the following three items in the interface:

- MCIP Data Directory – this directory contains processed WRF files output by MCIP for the EPIC simulation year. This tool requires only MCIP METCRO2D output files.

METCRO2D output files have to have names of the format METCRO2D*{DATE} in which * can be any nondigit characters and {DATE} can be in one of four date formats: YYYYMMDD, YYMMDD, YYYYDDD, or YYDDD (e.g., METCRO2D_051226)

- Deposition Selection – used to select one of the following three options:
 - CMAQ deposition directory: select this option to use CMAQ deposition output files. If this is selected, users have to set the CMAQ deposition file directory in the next field on the interface.
 - Default: this option assumes that the N mixing ratio is 0.8 ppm for wet oxidized N deposition. The tool computes wet oxidized N deposition based only on rainfall, and other N deposition variables are assumed to be zero.
 - Zero: this option assumes that there is no atmospheric N.
- CMAQ Deposition Directory – used to set the directory containing the CMAQ dry and wet deposition output files for the simulation year if “CMAQ deposition directory” was chosen in the previous field. The dry and wet deposition file names must contain the string “DRYDEP” or “WETDEP”. In addition, the deposition file names must end with “*{DATE}” in the format that is described for the MCIP files above (e.g., an MCIP file can be named as METCRO2D_20030416 and the deposition files can be named CCTM_M2f_v14soa_v3.4beta3_2003.DRYDEP.20030416 and CCTM_M2f_v14soa_v3.4beta3_2003.WETDEP1.20030416)

After Run has been clicked and the queue job has finished, users should check the log file under their scenario's **scripts** directory to see whether any errors occurred during execution. The tool generates the following three output files stored under **scenarios/"scenario name"/share_data**:

- **dailyWETH/"GRIDID".dly** – daily weather and N files for each selected grid cell for EPIC modeling. “GRIDID” is the identification number for a selected grid cell (see Figure 7). Each daily file contains 14 formatted data items (listed in Table 3) to be used in the EPIC runs for the simulation year (same as the weather year). This daily weather file is duplicated for the year before the simulation year because we run the EPIC model for a two-year period using daily time steps.
- **EPICW2YR.2YR** – daily weather file list to be used in EPIC application modeling. It is defined in $\${FESTC_HOME}/\text{epic}/\text{common_data}/\text{EPIC_model}/\text{app}/\text{EPICFILE.DAT}$.

- `site_weather_dep_{$YEAR}0101_to_{$YEAR}1231.nc` – a single netCDF file with daily time steps for the simulation year. It contains extracted daily weather and N deposition data for the EPIC grid cells in the `EPICSites_Info.csv` file. Users can use the *Visualization* tool (discussed in Section 7) to display the values of a selected variable spatially.

Table 3. EPIC daily weather and nitrogen deposition variables.

Index	Variable	Index	Variable
1	Year	8	Daily Average Relative Humidity
2	Month	9	Daily Average 10-m Wind Speed (m s ⁻¹)
3	Day	10	Daily Total Wet Oxidized N (g/ha)
4	Daily Total Radiation (MJ m ²)	11	Daily Total Wet Reduced N (g/ha)
5	Daily Maximum 2-m Temperature (C)	12	Daily Total Dry Oxidized N (g/ha)
6	Daily minimum 2-m temperature (C)	13	Daily Total Dry Reduced N (g/ha)
7	Daily Total Precipitation (mm)	14	Daily Total Wet Organic N (g/ha)

5. EPIC Spin-up Run Tools

Users must run EPIC spin-up simulations to generate chemically stable soil files and initial annual plant N demand data, which are used in EPIC application-year simulations. Described in this section are the five EPIC spin-up run tools: *EPIC Site File Generation*, *Soil Match for EPIC Spinup*, *Management File Generation for Spinup*, *View/Edit EPIC Inputs*, and *View/Edit EPIC Inputs*. Users can use these tools sequentially to generate files needed for EPIC spin-up simulations. Users can obtain detailed information on building the EPIC databases using developed programs from the documentation for the EPIC modeling system for CMAQ, and on the file formats and parameter descriptions from the EPIC model documentation from TAMU (<http://epicapex.tamu.edu/files/2013/02/epic0509usermanualupdated.pdf>).

5.1 EPIC Site File Generation

The *EPIC Site File Generation* tool uses the FORTRAN programs stored under `{$FESTC_HOME}/epic/util/siteCreate`. This tool generates EPIC site files for the selected grid cells with the minimum crop acreage limit criterion. It also creates 21 crop directories with a crop site list file that is to be used in the other tools. As simulations are performed, irrigated

and rainfed results are maintained as separate subdirectories under the overall crop directory. Figure 11 displays the tool interface for the test_case scenario. As explained in Section 4.2, users can change the Minimum Crop Acres if the 40-acre limit is too large for their modeling domain's grid cells.

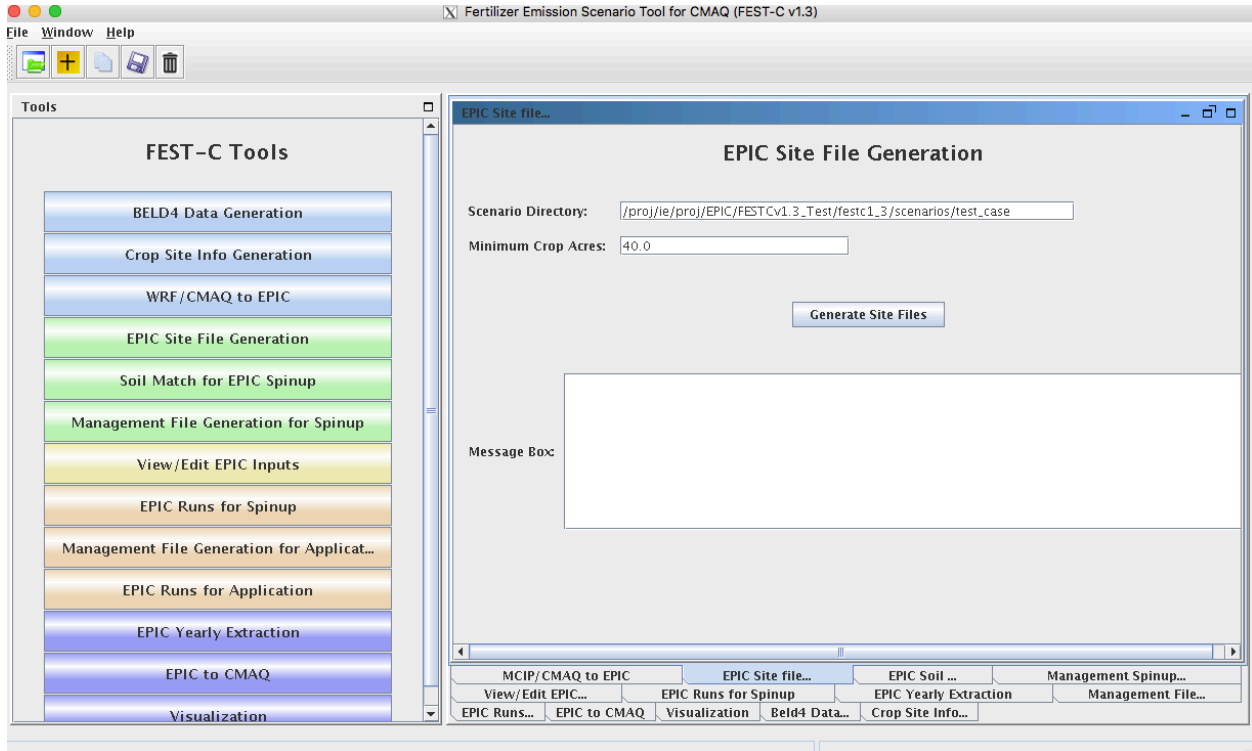

Figure 11. The *EPIC Site File Generation* interface for the test_case scenario.

After the queue job run has finished, users should check the log file under their scenario's **scripts** directory to see whether any errors occurred during execution. The tool generates the following files and directories:

- “scenario name”/share_data/SIT/“GRIDID”0.SIT – EPIC site files to be used for all EPIC crop modeling. A description of the file format can be obtained from the EPIC model documentation.
- “scenario name”/share_data/SITELIST.DAT – EPIC site list file for all crops to be used in EPIC modeling.

- “**scenario name**”/“**crop name**”/“crop name”-LIST.DAT – EPIC site list for the particular crop, to be used in the *Soil Match for EPIC Spinup* tool discussed in the following section. If there are no grid cells that contain that crop, this file will be empty.

5.2 Soil Match for EPIC Spinup

The *Soil Match for EPIC Spinup* tool selects a soil for each crop within a grid cell and creates the EPIC soil input file. The EPIC soil datasets are built to represent the sample point soils selected for USDA NRI data points at the HUC-8 spatial scale. This tool links built EPIC soil datasets contained in the **BaumerSoils** subdirectory to the soil series from the USDA NRI for the crop and grid cell. It uses the FORTRAN programs stored under `#{FESTC_HOME}/epic/util/soilMatch` with the common data files stored under `#{FESTC_HOME}/epic/common_data/util/soilMatch` and the generated soil list data under each crop directory. Figure 12 shows the tool interface used to match soils for all crops (as explained at the beginning of Section 5) for the current version of FEST-C. After selecting the crops, users click the Run button to run the tool in the queue. After the job has finished, users should check the queue job and log file in the “**scenario name**”/scripts directory, based on the information provided in the Message Box (shown in Figure 12).

The tool generates many output files under each crop directory, but most of them are intermediate files. The final data file created for the EPIC spin-up simulation is “**scenario name**”/“**crop name**”/SOILLIST.DAT, which contains the matched **BaumerSoils** soil file with other parameters for each grid cell under each crop directory. This step can take substantial time to complete.

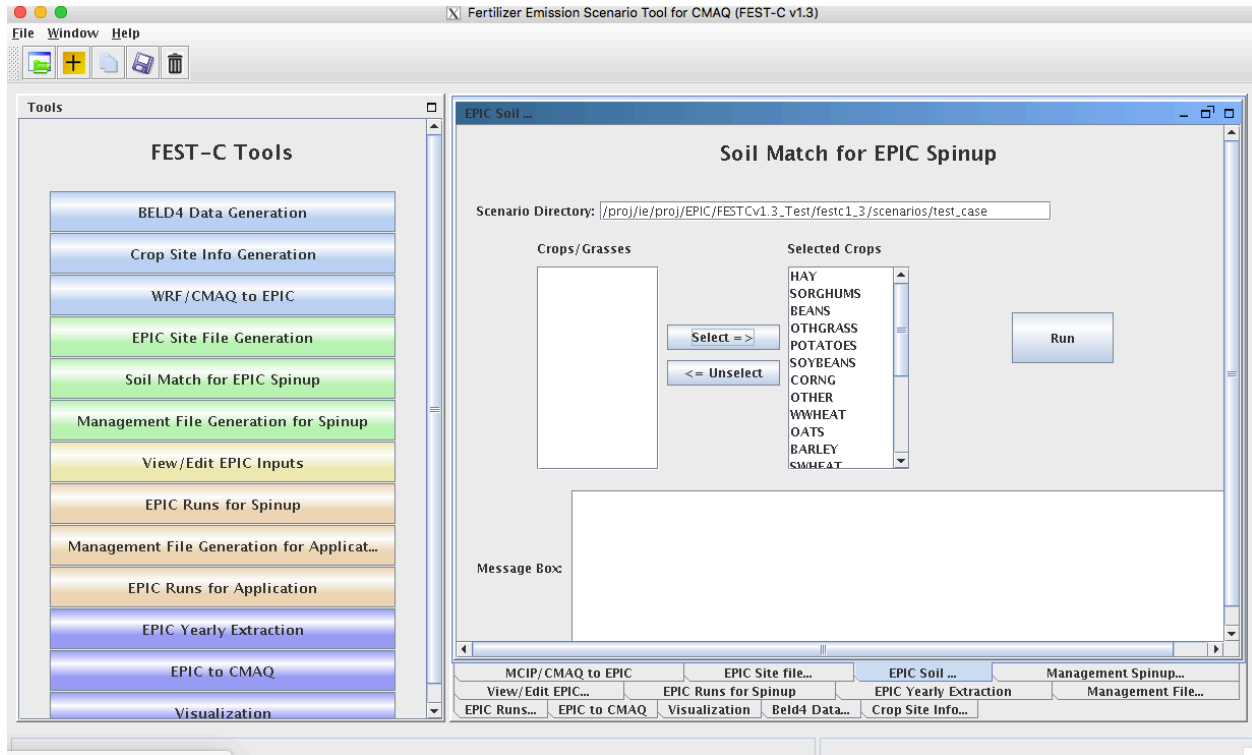

Figure 12. The Soil Match for EPIC Spinup tool interface used for the test_case scenario. Users can select single or multiple crops for the current FEST-C version.

5.3 Management File Generation for Spinup

The *Management File Generation for Spinup* tool interface is used to create the EPIC management for each crop within a grid cell. The EPICRUN file that has the linkages for the grid cell, statistical weather and wind files, soil files, and management files is also created for the rain-fed and irrigated forms of the crop. This tool uses the FORTRAN programs ManGenSU.exe and soildrain.exe stored under `#{FESTC_HOME}/epic/util/manageCreate` with the common data files stored under `#{FESTC_HOME}/epic/common_data/util/manageCreate` and many other data files generated under each crop directory. Figure 13 shows the tool interface used to generate management files for the test_case scenario.

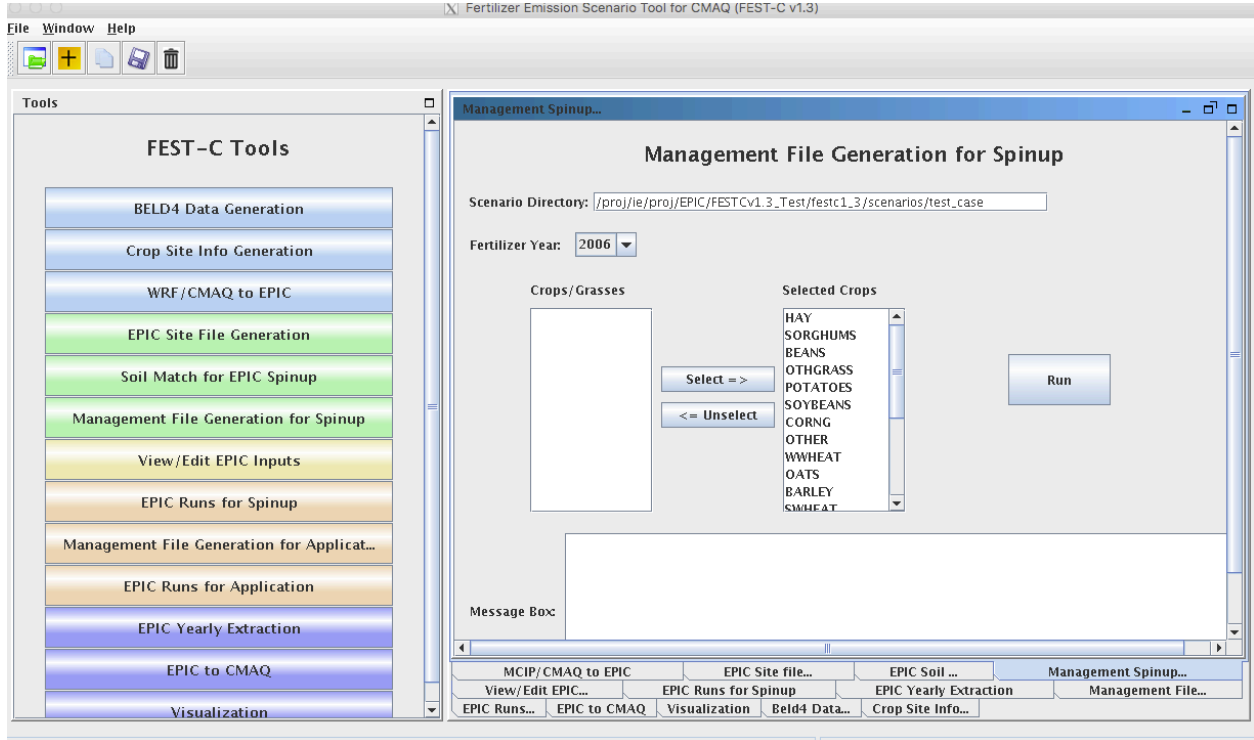

Figure 13. The *Management File Generation for Spinup* tool used for the test_case scenario.

Users need to make sure that the following two fields are selected correctly:

- Fertilizer Year – select either 2001 or 2006 for choosing the correct common data sets stored under `#{FESTC_HOME}/epic/common_data/util/manageCreate`. 2011 fertilizer year will be available in future releases. NLCD/MODIS 2011 is available in this release and can be used (e.g. changes in crop fraction) with the 2006 fertilizer year but changes to fertilizer types for 2011 will not be realized in these simulations.
- Selected Crops – select one crop or multiple crops.

After the user clicks the Run button and then “OK”, a queue job to generate management files for each selected crop is submitted. After the job has finished, users should check the queue job and log file in the “**scenario name**”/scripts directory, based on the information provided in the Message Box (shown in Figure 13).

There are many output files generated under each crop, but many of these are used just for verification. The tool generates the following files to be used for the EPIC spin-up simulations under the directory “**scenario name**”/“**crop name**”/spinup/manage for each crop:

- EPICRUNFILERAIRN.DAT – EPIC run file for rain-fed spin-up simulation of this crop.
- EPICRUNFILEIRR.DAT – EPIC run file for irrigated spin-up simulation of this crop.
- GRIDS_OPC.DAT – the list of management file names to be used in EPIC modeling.
- **OPC**/"GRIDID"0"BELD3 Crop Number".OPC – grid cell EPIC management files under the **OPC** directory. Table 1 in Section 4.1 lists the crop numbers in the BELD data and how they are mapped, Table 2.
- tileDrain/SOILLIST.DAT – soil list file which contains tile drain information for EPIC simulations and is used when "tileDrain" is selected when running EPIC spinup simulations.

5.4 View/Edit EPIC Inputs

The *View/Edit EPIC Inputs* interface allows users to view or edit five main EPIC simulation files (listed in Figure 14). Users generally do not need to edit these files, but viewing them can be helpful for debugging. The user selects a crop and then selects the EPIC simulation type. The simulation type can be SPINUP if the *Management File Generation for Spinup* tool (previous section) has been executed for the selected crop; or the user can select the simulation type APP after the *Management File Generation for Application* tool (discussed in Section 6.1) has been executed for the crop. Figure 14 shows the *View/Edit EPIC Inputs* tool interface for the test_case scenario.

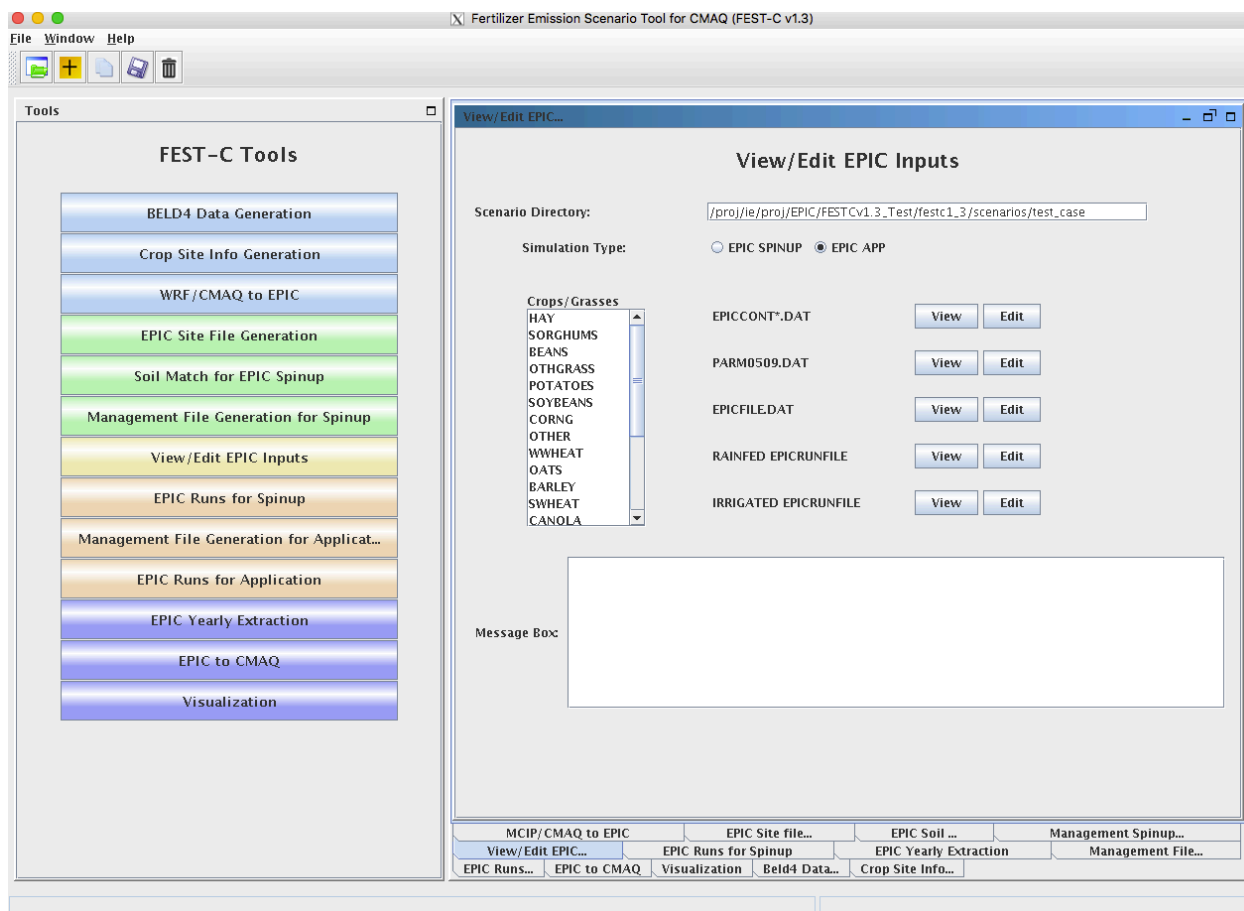

Figure 14. The *View/Edit EPIC Inputs* tool for the test_case scenario.

5.5 EPIC Runs for Spinup

The *EPIC Runs for Spinup* tool interface is used to run the EPIC model for spin-up (EPICsu.exe program), which is stored under the directory $\{\text{FESTC_HOME}\}/\text{epic}/\text{model}/\text{current}$. The tool uses input files stored primarily in the following directories:

- $\{\text{FESTC_HOME}\}/\text{epic}/\text{common_data}/\text{EPIC_model}/\text{spinup}$ – for the common model input files.
- $\text{scenarios}/\text{"scenario name"}/\text{share_data}$ – for site files and list file.
- $\{\text{FESTC_HOME}\}/\text{epic}/\text{common_data}/\text{statWeath}$ – for observed climate station statistical data (see <http://epicapex.tamu.edu/epic/>)
- $\text{scenarios}/\text{"scenario name"}/\text{"crop name"}/\text{spinup}/\text{manage}$ – for the run files, management files, and management list file.
- $\text{scenarios}/\text{"scenario name"}/\text{"crop name"}$ – for the soil list file.

Spin-up simulations generate EPIC chemical soil files reflecting the user-defined management to be used as initial conditions in the application run for the simulation year. Soil erosion (wind and water) is “turned off” during the spin-up period to avoid loss of productive soil layers. These losses are “turned on” during application year simulation. As discussed in Section 2, the spin-up simulation is run for 25 years starting from 1978 for all crops except potatoes; for potatoes it is run for 100 years starting from 1903. These dates are strictly used for “bookkeeping” and are not used in subsequent steps. Statistically generated weather conditions for Cooperative Observer Weather Stations during the period 1980-2010 drive these simulations. Future releases are expected to support input of alternative sources of long-term, i.e., 25 years or more weather information. Figure 15 displays the tool interface used for the test_case scenario. Users can select one or more crops for the simulation. After clicking the Run button, a script file is generated to run the rain-fed and irrigated EPIC spin-up simulations for each crop. The user submits the script file to the queue by clicking OK. After the job has finished, users should check the queue job and log file in the “**scenario name**”/scripts directory, based on the information provided in the Message Box (shown in Figure 15).

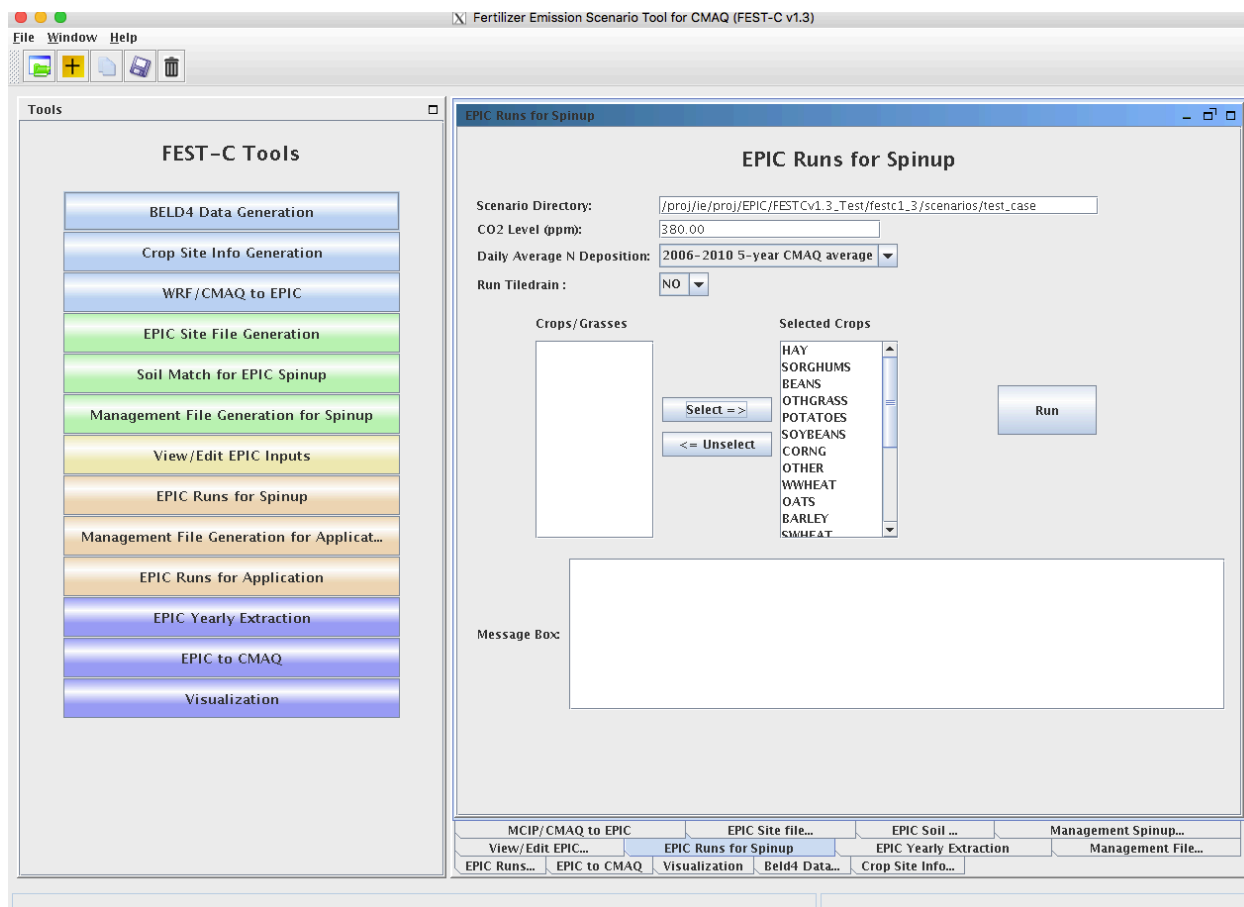

Figure 15. The *EPIC Runs for Spinup* tool used for the test_case scenario.

Users need to make sure that the following three fields are selected correctly:

- CO₂ Level (ppm) - input the correct CO₂ level for the simulation (e.g. 380). The input level overwrites the CO₂ level defined in EPICCONT.DAT and site file.
- Daily Average N Deposition – select N input to be used in the simulation. Users can select using the values defined in EPIC input files, daily average N input from 5-year CMAQ simulations from 2002 to 2006, or daily average N input from 5-year CMAQ simulations from 2006 to 2010. The 5-year CMAQ N daily input files are stored under `#{FESTC_HOME}/epic/common_data/EPIC_model`. Future releases will include daily average N input from 5-year CMAQ simulations from 2011 to 2015.
- Run TileDrain – select whether tile drain is applied for saturated soils. If YES is selected, SOILLIST file under `scenarios/“scenario name”/“crop name”/spinup/manage/tileDrain` will be used for all crops except hay (1, 2), alfalfa (3, 4), Other_Grass (5, 6) and rice (23, 24).

The tool generates many directories and files for each crop. The original EPIC output files are stored under the two following subdirectories in the “**scenario name**”/“**crop name**”/“**spinup**” directory:

- **rainf** – contains output from EPIC rain-fed spin-up simulations for this crop.
- **irr** – contains output from EPIC irrigated spin-up simulations for this crop.

In both cases, soil files to be used in the EPIC application simulation are:

- **SOL**/“GRIDID”0“BELD3 Crop Number”.SOL

The output data created for CMAQ modeling are used primarily for QA purposes, and are stored under the following two directories in the “**scenario name**”/“**output4CMAQ**”/“**spinup**” directory:

- **5years** – contains average EPIC output data from the last five years of the spin-up simulations for the crops.
- **daily** – stores daily EPIC output data from EPIC spin-up runs for the crops simulated.

6. EPIC Application Run Tools

After users complete the EPIC simulations for spin-up, they can proceed to the EPIC application run tools for the simulation year. The spin-up simulations need to be run only once for a given domain and grid resolution—in other words, the initial conditions can be re-used for multiple application years. The first step in running an EPIC application is to generate management files for the application year (as described in Section 6.1). The application management program needs to be run only once for a given domain and grid resolution; it is not year-specific. The user can then run the EPIC model for the application year (as described in Section 6.2) if the daily weather and N deposition files for the scenario have already been generated using the tool described in Section 4.3.

6.1 Management File Generation for Application

The *Management File Generation for Application* tool interface is used to create (1) the EPIC management files for each crop to be used in the EPIC application-year modeling; and (2) the EPICRUN file for the rain-fed and irrigated simulations, which contains the linkages for the statistical weather and wind files, the soil files, and the management files for EPIC grid cells. The tool uses the FORTRAN programs ManGenFERT.exe and soildrain.exe stored under the

`\${FESTC_HOME}/ epic/util/manageCreate directory with the common data files stored under **`\${FESTC_HOME} /epic/common_data/util/manageCreate** and many other data files generated under each crop directory. Figure 16 shows the tool interface used to generate management files for the test_case scenario. The user needs to make sure that the following two entries are selected correctly:

- Fertilizer Year – select 2001 or 2006. The common management and fertilizer data sets created under the **`\${FESTC_HOME}/epic/common_data/util/manageCreate** will be used accordingly. This management tool uses the created fertilizer data types for the 10 crop production regions. Fertilizer for 2011 will be available in a future release.
- Selected Crops – select one or more crops.

After clicking the Run button, a script file is generated to compute the management files for the selected crops. The user submits the script file to the queue by clicking OK. After the job has finished, users should check the queue job and log file in the “**scenario name**”/scripts directory, based on the information provided in the Message Box (shown in Figure 16).

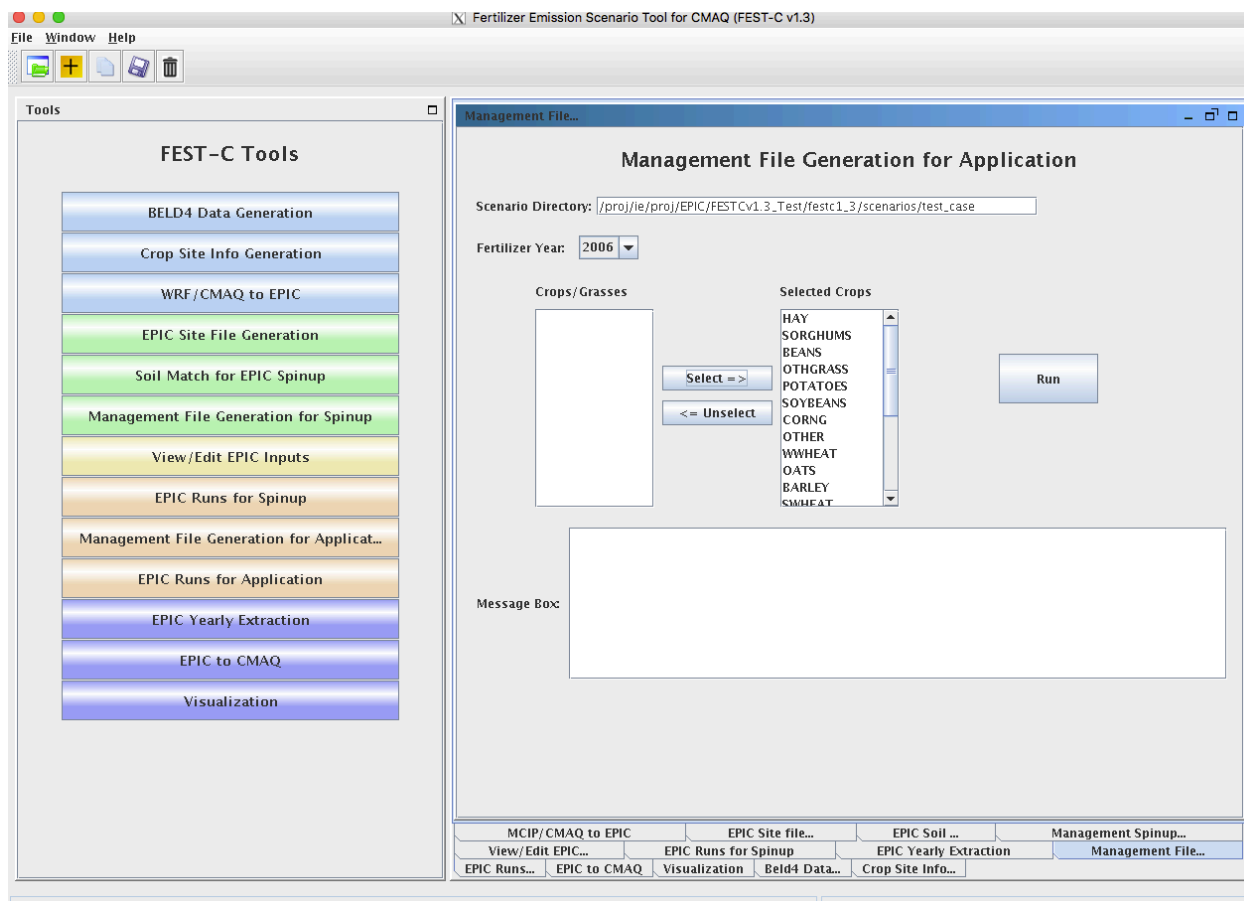

Figure 16. The *Management File Generation for Application* tool interface used for the test_case scenario.

The tool will generate many output files under each crop, but many of these are used just for verification. The tool generates the following files under the “scenario name”/“crop name”/app/manage directory:

- EPICRUNFILERAINDW.DAT – EPIC run file for rain-fed application simulation.
- EPICRUNFILEIRRDW.DAT – EPIC run file for irrigated application simulation.
- GRIDS_OPC.DAT – the list of management file names to be used in EPIC modeling.
- OPC/“GRIDID”0“BELD3 Crop Number”.OPC – grid cell EPIC management files under the OPC directory. Table 1 in Section 4.1 lists the crop numbers in the BELD data.
- tileDrain/SOILLIST.DAT – soil list file which contains tile drain information for EPIC simulations and is used when “tileDrain” is selected when running EPIC application simulations.

6.2 EPIC Runs for Application

The *EPIC Runs for Application* tool interface is used to run the EPIC model for the simulation year (EPICapp.exe program), which is stored under the directory **`\${FESTC_HOME}/epic/model/current**. However, the user must already have generated the site daily weather and N deposition files using the *WRF/CMAQ-to-EPIC* tool interface (see Section 4.3). The *EPIC Runs for Application* tool uses input files stored primarily in the following directories:

- **`\${FESTC_HOME}/epic/common_data/EPIC_model/app** – for the common model input files.
- **scenarios/“scenario name”/share_data** – for the EPICCONT.DAT file, site files, and site list file, and daily weather and N deposition files and weather list file.
- **`\${FESTC_HOME}/epic/common_data/statWeath** – for observed climate station statistical data.
- **scenarios/“scenario name”/ “crop name” /app/manage** – for the run files, management files, and management list file.
- **scenarios/“scenario name”/ “crop name”/spinup/rainf/SOL** – for the soil files to be used in the rain-fed simulations.
- **scenarios/“scenario name”/ “crop name”/spinup/irr/SOL** – for the soil files to be used in the irrigated simulations.

Figure 17 shows the tool interface used for the test_case scenario. The Simulation Year is defined when the user creates the scenario. Users can select one or multiple crops for the simulation. After clicking the Run button, a script file is generated to run the rain-fed and irrigated EPIC application simulations for each crop. The EPIC application simulations will run for a two-year period (the previous year and the simulation year) using the same daily weather and N deposition files for the simulation year; the two-year period is needed in order to simulate a full growing season for fall-sown crops. The user submits the script file to the queue by clicking OK. After the job has finished, users should check the queue job and log file in the **“scenario name”/scripts** directory, based on the information provided in the Message Box (shown in Figure 17).

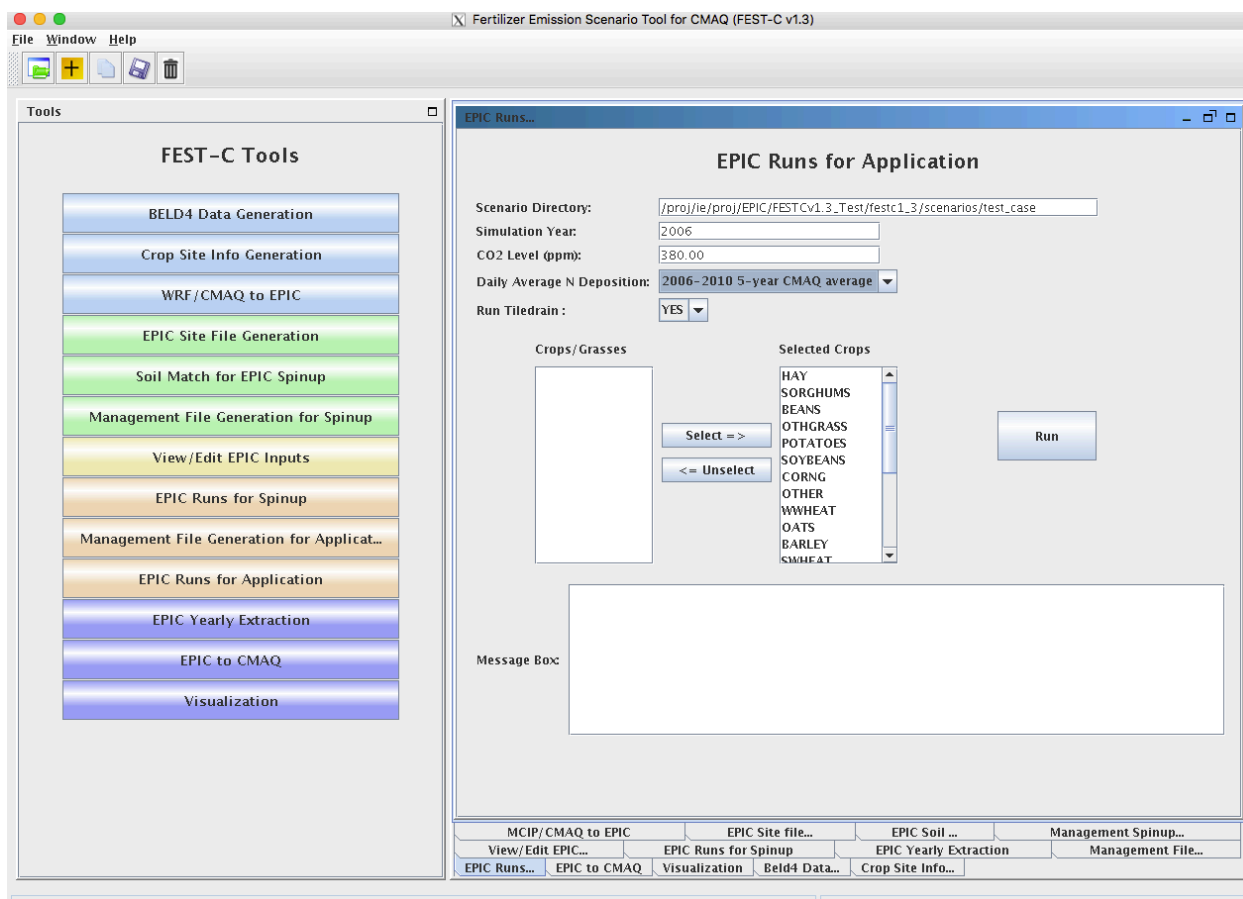

Figure 17. The *EPIC Runs for Application* tool interface used for the test_case scenario.

Users need to make sure that the following three fields are selected correctly:

- CO₂ Level (ppm) - input the correct CO₂ level for the simulation (e.g. 380). The input level overwrites the CO₂ level defined in EPICCONT.DAT and site file.
- Daily Average N Deposition – select N input to be used in the simulation. Users can select using the CMAQ N values in daily weather files, values defined in EPIC input files, daily average N input from the 5-year CMAQ simulations from 2002 to 2006, or daily average N input from the 5-year CMAQ simulations from 2006 to 2010. The 5-year CMAQ N daily input files are stored under **`\${FESTC_HOME}/epic/common_data/EPIC_model**.
- Run TileDrain – select whether tile drain is applied for saturated soils. If YES is selected, SOILLIST file under **scenarios/“scenario name”/“crop name”/app/manage/tileDrain** will be used for all crops except hay (1, 2), alfalfa (3, 4), Other_Grass (5, 6) and rice (23, 24).

The tool generates many directories and files for each crop. The original EPIC output files are stored under the following two subdirectories in the “**scenario name**”/“**crop name**”/app directory:

- **rainf** – contains output from EPIC rain-fed application simulations for this crop.
- **irr** – contains output from EPIC irrigated application simulations for this crop.

The output data created for CMAQ modeling are stored under the following two subdirectories in the “**scenario name**”/output4CMAQ/app directory:

- **year** – contains average EPIC output data for the simulation year (one year) run for the crops simulated. These data are used primarily for QA purposes.
- **daily** – stores daily EPIC output data from EPIC application runs for the crops simulated. These data are used to extract the input for CMAQ bidirectional NH₃ modeling.

7. Output Processing and Visualizing Tools

EPIC is a field-based model that generates output in formatted text files. In the domain-based EPIC modeling within FEST-C, the crops in each grid cell are modeled individually. Thus, there are many text output files generated for each crop in each grid cell selected for EPIC modeling. In this section we first describe the *EPIC Yearly Extraction* tool and the *EPIC-to-CMAQ* tool. Developed in the SA Raster Tools system, these two tools extract yearly or daily EPIC output variables into NetCDF-format files for QA purposes and for CMAQ modeling. We then discuss the *Visualization* tool interface, which allows users to prepare spatial views of the EPIC output variables in the created NetCDF files over their modeling scenario domain.

7.1 EPIC Yearly Extraction

The *EPIC Yearly Extraction* tool is used to extract 48 crop-specific variables and 39 crop-area-weighted variables into two NetCDF files from the yearly average EPIC output files for all simulated crops within the grid cells that were selected. The output from this tool is used primarily for QA purposes, to make sure that the EPIC simulation results appear to be spatially reasonable over the domain area. Figure 18 shows the tool interface used for the test_case scenario. The only item users need to select is Output Type:

- EPIC SPINUP – select this to extract yearly average variables from the EPIC spin-up simulations. Yearly average variables from the last five years of the simulations are from the output stored under the “**scenario name**”/output4CMAQ/spinup/5years directory.
- EPIC APP – select this to extract yearly average variables from the EPIC simulations for the application year. The yearly average variables are from the output stored under the “**scenario name**”/output4CMAQ/app/year directory.

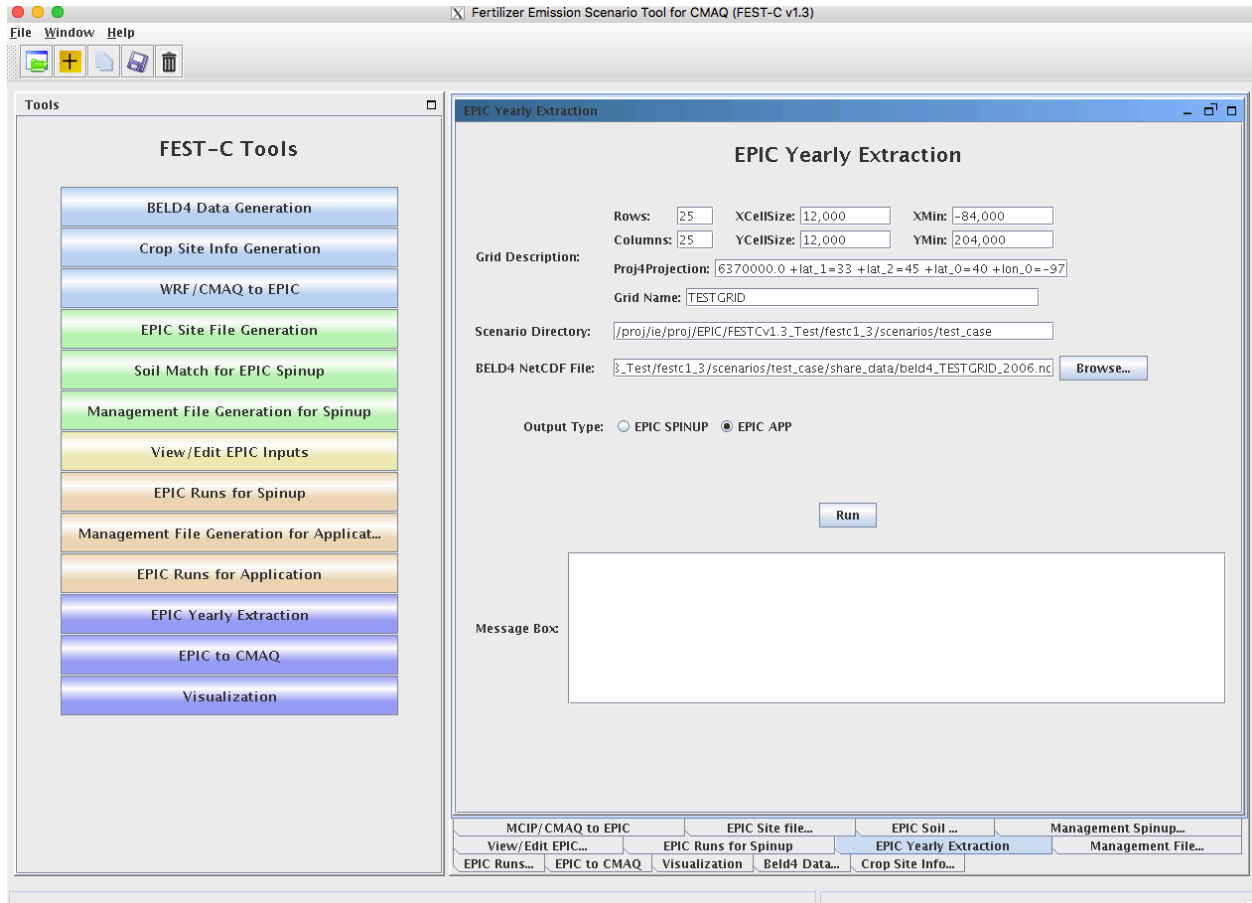

Figure 18. The *EPIC Yearly Extraction* tool interface used for the test_case scenario.

Table 4 lists all of the variables that are in the two EPIC output files created by the tool: epic2cmaq_year.nc (crop-specific output) and epic2cmaq_year_total.nc (crop-weighted output). These files are stored in one of the following two directories:

- **scenarios/“scenario name”/output4CMAQ/spinup/ toCMAQ** – if the EPIC SPINUP output type was selected.

- **scenarios/“scenario name”/output4CMAQ/app/toCMAQ** if the EPIC APP output type was selected.

Users should check the log file under their scenario’s **scripts** directory to see whether any errors occurred when the tool was run.

If the user is visualizing the data using the VERDI tool for visualization, there is no time dimension. Data layers are assigned to individual crops (see Table 1 in Section 4.1 for the BELD crop numbers).

Table 4. EPIC yearly extraction output variables.

epic2cmaq_year.nc - crop specific output					
Index	Name	Variable	Index	Name	Variable
1	GMN	N Mineralized (kg/ha)	25	FTP	P Applied (kg/ha)
2	NMN	Humus Mineralization (kg/ha)	26	IRGA*	Irrigation Volume Applied (mm)

*Water on agricultural lands.

7.2 EPIC to CMAQ

The *EPIC-to-CMAQ* tool is used to extract 13 variables from EPIC soil output files and 40 variables from EPIC daily output files into NetCDF files for all simulated crops within the grid cells that were selected. The output from this tool is used as input to CMAQ bidirectional NH₃

modeling over the domain area. Figure 19 shows the tool interface used for the test_case scenario. The user needs to input only one item:

- Output File Prefix – this is used as the file prefix for all of the NetCDF output file names.

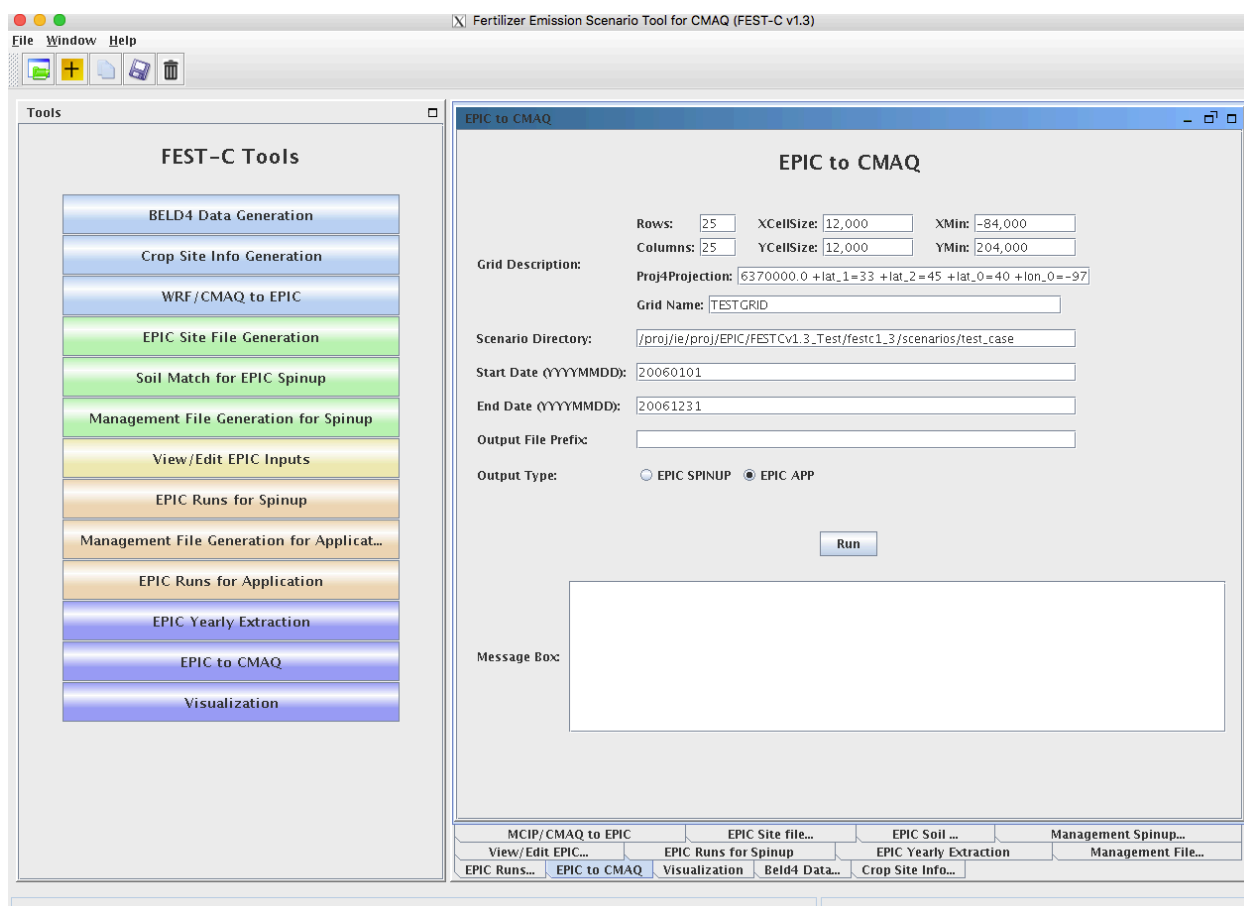

Figure 19. The EPIC-to-CMAQ tool interface used for the test_case scenario.

The following output files produced by the tool are stored under the **scenarios/“scenario name”/output4CMAQ/app/toCMAQ** directory:

- “Output File Prefix”_soil.nc – soil output file that contains 13 soil variables extracted from the EPIC soil output files (“scenario name”/output4CMAQ /app/daily/“BELD4 Crop Number”.NCS); these variables are listed in Table 5. Layer1 and Layer2 are for the soil depth from 0 to 1 cm and from 1 cm to 100 cm, respectively. “T_” variables are full the full soil profile. If the profile extent is less than 100 cm, these values should be commensurate with L1 and L2 results. If the profile extends beyond 100 cm, then it will differ from L1 and L2 values.

- “Output File Prefix”_timeYYYYMMDD.nc – daily NetCDF files for the simulation year. A daily NetCDF file contains 40 variables extracted from the EPIC daily output files (“scenario name”/output4CMAQ /app/daily/“BELD4 Crop Number”.NCD”); these variables are listed in Table 6. Layer1, Layer2, and Total are for the soil depth from 0 to 1 cm, from 1 cm to 100 cm, and from 0 cm to the full Baumer soil profile depth, which can be more than 1 m.
EPIC SPINUP – select this to extract daily variables from the EPIC spin-up simulations. Daily variables from the simulations are from the output stored under the “scenario name”/output4CMAQ/spinup/daily directory.
- EPIC APP – select this to extract daily variables from the EPIC simulations for the application year. The daily variables are from the output stored under the “scenario name”/output4CMAQ/app/daily directory.

Table 5. EPIC-to-CMAQ soil output variables.

Index	Name	Soil Variable	Index	Name	Soil Variable
1	L1_SoilNum	Soil Number (none)	8	L2_Bulk_D	Layer2 Bulk Density (t/m**3)
2	L1_Bulk_D	Layer1 Bulk Density (t/m**3)	9	L2_Wilt_P	Layer2 Wilting Point (m/m)
3	L1_Wilt_P	Layer1 Wilting Point(m/m)	10	L2_Field_C	Layer2 Field Capacity (m/m)
4	L1_Field_C	Layer1 Field Capacity (m/m)	11	L2_Porosity	Layer2 Porosity (%)
5	L1_Porosity	Layer1 Porosity (%)	12	L2_PH	Layer2 PH (none)
6	L1_PH	Layer1 PH (none)	13	L2_Cation	Layer2 Cation Ex (cmol/kg)
7	L1_Cation	Layer1 Cation Ex (cmol/kg)			

Table 6. EPIC-to-CMAQ daily output variables.

Index	Name	Variable	Index	Name	Variable
1	DN	N-NO3 Denitrification (kg/ha)	21	L2_NH3	Layer2 N - Ammonia (kg/ha)
2	DN2*	N-N2O from NO3 Denitrification (kg/ha)	22	L2_ON	Layer2 Organic N (kg/ha)
3	HMN	OC Change by Soil Respiration (kg/ha)	23	L2_C	Layer2 Carbon (kg/ha)
4	NFIX	N Fixation (kg/ha)	24	L2_NITR	Layer2 N - Nitrified NH3 (kg/ha)
5	YW	Wind Erosion (ton/ha)	25	T_DEP	Layer2 Depth

					(m)
6	FPO	Organic P Fertilizer (kg/ha)	26	T_BD	Layer Bulk Density (t/m**3)
7	FPL	Labile P Fertilizer (kg/ha)	27	T_NO3	Layer N - Nitrate (kg/ha)
8	MNP	P Mineralized (kg/ha)	28	T_NH3	Layer N - Ammonia (kg/ha)
9	L1_DEP	Layer1 Depth (m)	29	T_ON	Layer Organic N (kg/ha)
10	L1_BD	Layer1 Bulk Density (t/m**3)	30	T_C	Layer Carbon (kg/ha)
11	L1_SW	Layer 1 Soil Moisture (mm)	31	T_NITR	Layer N - Nitrified NH3 (kg/ha)
12	L1_NO3	Layer1 N - Nitrate (kg/ha)	32	L1_ANO3	Layer1 N-NO3 AppRate (kg/ha)
13	L1_NH3	Layer1 N - Ammonia (kg/ha)	33	L1_ANH3	Layer1 N-NH3 AppRate (kg/ha)
14	L1_ON	Layer1 Organic N (kg/ha)	34	L1_AON	Layer1 ON AppRate (kg/ha)
15	L1_C	Layer1 Carbon (kg/ha)	35	L2_ANO3	Layer2 N-NO3 AppRate (kg/ha)
16	L1_NITR	Layer1 N - Nitrified NH3 (kg/ha)	36	L2_ANH3	Layer2 N-NH3 AppRate (kg/ha)
17	L2_SW	Layer 2 Soil Moisture (mm)	37	L2_AON	Layer2 ON AppRate (kg/ha)
18	L2_DEP	Layer2 Depth (m)	38	LAI	Leaf Area Index (none)
19	L2_BD	Layer2 Bulk Density (t/m**3)	39	CPHT	Crop Height (m)
20	L2_NO3	Layer2 N - Nitrate (kg/ha)	40	FBARE	Bare Land Fraction for Wind Erosion (Fraction)

*DN2 is currently under revision, and AVOL is an initial estimate that is revised within the bidirectional CMAQ.

When the user clicks the Run button, a script file is generated under the scenario's **scripts** directory. The script file is submitted to the queue for execution after the user clicks OK. A

CMAQ-ready file is generated for each day and is viewable in VERDI. After the queue job has completed, users should check the log file under the **scripts** directory to see whether any errors occurred during execution.

7.3 Visualization

The *Visualization* tool interface is used to invoke the VERDI interface to view a selected NetCDF data set. Figure 20 shows the appearance of the tool interface before an input file has been selected. Users can select the data type on the left side of the interface window and then browse through the file systems to select a NetCDF file created or used within the FEST-C system (e.g., an EPIC output NetCDF file created by the previous two tools, a BELD4 data set, MCIP and CMAQ data sets, a daily weather and N deposition NetCDF output file). Clicking the Display button invokes the VERDI interface to visualize the selected NetCDF file. **Note:** For this to work properly, the user has to have set the VERDI system in the FEST-C configuration file `config.properties` (see Section 1.3). Information on how to use the VERDI system can be obtained from the CMAS VERDI site: <http://www.cmascenter.org/verdi/>.

8. Future Work

In this release, 2011 NLCD/MODIS data is available to produce crop fractions for Canada and the US. To accompany this data, future release will include an updated fertilizer type scenario for 2011. In addition, we will continue to improve the crop fraction coverage with including data from Mexico. We are also exploring the possibility of moving to computing crop land use data directly from USDA National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) data. This would provide higher-resolution information; however, these data do not include some information that is critical for using EPIC (such as differentiation between irrigated and rain-fed crops), so further exploration is needed.

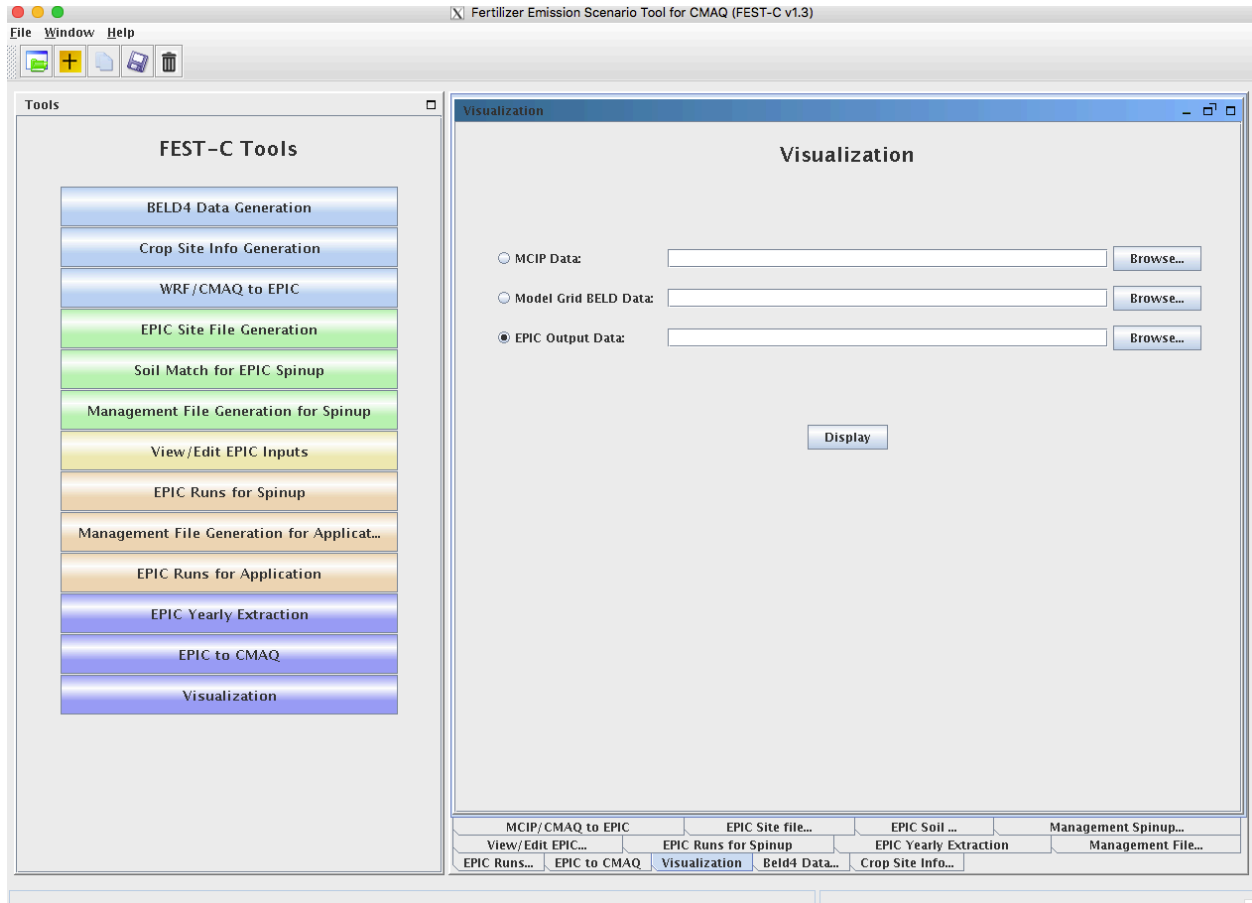

Figure 20. The Visualization tool interface.

We are also helping the EPA apply the FEST-C system to address multimedia (air, land, water) questions related to biofuels production and climate change. We are exploring using FEST-C to study not only the effects of agricultural practices (e.g., fertilizing and management practices) on air quality (NH₃), climate (N₂O), and climate change, but also the effects of meteorology and climate on agricultural productivity, soil erosion, water quantity, and water quality.

Acknowledgments

The development of the FEST-C system is currently being sponsored and directed by the U.S. EPA's Computational Exposure Division (CED) under U.S. EPA contract EP-W-16-014, "Operation of the Center for Community Air Quality Modeling and Analysis (CMAS)" in support of Office of Research and Development Air Climate and Energy, Safe and Sustainable Waters and Safe and Healthy Communities Research Programs. This work was also supported under prior U.S. EPA contracts: EP-W-09-023, "Operation of the Center for Community Air Quality Modeling and Analysis (CMAS)," and EP-D-12-044, "Emissions, Air Quality, and Meteorological Modeling Support (EMAQ)." We thank Dr. Ellen Cooter, the EPA Work Assignment Manager for the work described in this document, for her leadership on this project. We also greatly appreciate the continuing and generous intellectual support we have received from Dr. Jimmy R. Williams at Texas A&M AgriLife Research, Blackland Research & Extension Center (Temple, TX). We thank Joe Slater, Manager of Fertilizer/AG Lime Control Services, University of Missouri Agricultural Experiment Station at Columbia, MO, for his invaluable insights regarding fertilizer sales and use. Finally, we thank Dr. Qun He for his design and support on the FEST-C interface.
